[QUOTE](#)

Smarties -  
I believe it is the same as the [Snowflake](#), except the pieces are hollow squares instead of solid squares. I think it was talked about in one of the Squareflake threads, a couple months ago.

"The wind is the perfect reminder of God.  
The only way we can prove it exists is by observing the things it affects.  
That's why I believe in the wind, too."

However, I can understand most kite plans, no matter what the language.

I have the two most recent issues of the Drachen magazine, Hoch Hinaus. I have found a photo of this kite heading an article reporting on the 2003 St-Goar kite festival but I have not seen any plans in these issues, or mentioned in the magazine's archives.

Cheers

---

Spectre is a mystery man. He did not put his town or country in his profile. Is he from Germany? I did notice that when I was at the Berck Sur Mer festival a few years ago that the Germans liked to build the big versions of various kites. The proportions were impressive.

The only 'issue' I have had with making high aspect (*skinny*) Facet Kites (*Hi Scott*) is that the shorter spine length has less 'authority' over the corners and the kites like to distort out of shape. The cure was to either bend metal tubing for the outside corners or use dihedrals.

good heavens;

knot(ty)ronda

Ronda; by his name and what I read on his web site, I would say our mystery man is from Turkey.

Amen!

Just a couple of quick thoughts before I go back to making Circoflex bridles for MAKR this weekend.

Since the early posts in this thread referred to Spectre's kite as a type of Snowflake Facet, I just wanted to toss in to the discussion that Snowflakes and Facets are tensegrity construction, the tensioning frame is on the outside of the kite. Spectre's kite is framed internally. There is a Spine or Longerons, in the center of which is a tinker toy doughnut for the Spreaders.

I think that when the plans are available, most of the fabric panels will be slightly trapezoidal rectangles.

good heavens;  
Gary E

Spectre, looks like this is your first post in this forum. Thanks for taking the time to give your feedback. Is this kite your original design?

Can you make the drawings in PDF format or maybe in JPEG or BMP?

Thanks,  
Smarties 😊

Please tell me you have seen the movie. knot(ty)ronda

Ronda, you're the bestest.

Despite seeing the movie, it didn't really 'click'.

You're just way ahead of me. 😊

At OKR, Ronda had half the room doing dialogs from every movie we could think of. 😎

good heavens;

Gary E

As he was assembling it I noticed tthe <b>center hub and radial spars</b> ☹️ Sure enough it was similar to the one that started this whole line of discussion. He had made the hub of <b>Carbon</b> fiber tubes epoxied together. I have a few photos at home I will post, but none of the center hub ☹️ I think Kiteguy got some photos too, but he is at Fort Wordon right now 🇺🇸</p> <div> <a href="#">PROFILE</a> <a href="#">PM ME!</a>  <a href="#">E-MAIL</a> </div>

I think he made the kite some years ago. I would guess that it was over three feet tall. Another interesting thing was that he had vertical spars halfway out between the center spine and the tips. When he put it together, it didn't look too taught, but then I saw where the other spars went. He didn't put them in because it was too much work for just having it hanging there. Here is the photo I have. I hope that Kiteguy has better ones that he can post next week. 😊 The spar went right where the pink and the black meet. There were closed end pockets and he said that he would connect one side, put the middle spars in and then slide the top half over the middle spars before connecting it to the spreader spars. Like Steve said, I would expect the hub to be bulky, but it was fairly flat. 😊</p>

Hi,

today I turned home. And try to make a detailed plan for Doublestar.

I tried to complete the plan all the day but not. Here is an uncompleted plan for Doublestar. But you can find the dimensions of the panels in several formats.

The original dimensions are in centimeters. I convert them also to inch.

And also I put A1 paper size PDF documents. If you find somewhere to print in A1, it will be better.

Here is the link.

<http://www.ucurtma.org/doublestar.html>

I hope I'll finish it in a few days. My English is not so good. And this one is my first detailed plan of a kite. So tell me what you want to see in a detailed plan and also my mistakes. So I can prepare a good Plan.

Best Winds,  
Ferruh Baysu

Thank you !!

that is a great help! I know you will be adding more in the near future ! now I have a better understanding of the kite ! that will be a impressive and interesting kite to build ! thanks again! what is the weight of your center fitting ??? looks like plywood and tube of some type ??

very good pics and drawing !! 😊

Looking foward to seeing the rest of your plans !

have a good day!

thanks again Ferruh Baysu 😊

that is very well done ! I will keep in touch with you as I build it! will post pics as I go along as I have done for all my other kites ! As you have read here their will be more Double Stars goin up this summer thanks to your plan! You are contributing to painting the sky internationally 😊

now to put in the order ! .....Before Gary buys everything\*grin\*

for those that wants to know 😊

this is roughly what I will be ordering and prices are approximately ....

Fabric

No 1 colour FRNC 75B rasp 4 yd \$14.00 us

No 2 colour FRNC 75B white 5 yd 20.00 us

No 3 colour FRNB 75A Ice Blue 4 yd 32.00 us

No 4 colour FRN 75B blue 3 yd 12.00 us

Spars No price here yet !

13 10mm x 60" (2 are for spares)

2 arrow nock for 10mm

14 end caps for 10mm

fitting no price here either

tinkertoy for 10mm with a center for a 10mm

now the order may be a bit bigger as they may be more locals that wants to add to the order !

but that is a quideline for now ! Hope SteveF will clear that up soon ! 😊

keep watching 😊

**Grant L wrote:**

He had made the hub of <a href="http://www.kitebuilder.com/catalog/index.php?cPath=33">Carbon</a> fiber tubes epoxied together. I have a few photos at home I will post, but none of the center hub 🙄 I think Kiteguy got some photos too, but he is at Fort Wordon right now 🌐

I am baaack! Survived Ronda's class, too!

The star kite that Grant is talking about was made about 3 years ago, but from plans in a 1989 magazine.

The hub was cool. I was trying to think of ways to drill the holes in material. I never thought of taking material with holes (tubing) and building the hub material around it. Looks strong enough to me.

While at Seattle I visited a kite shop and bought a Lotus kite. It is 3 or 4 ft in diameter. The one at MAKR was 5 ft diameter. (Just a bit more, each spar was 32 1/2 inch long.)

We are working on a sample fitting for this kite. Its gonna be a big one.

Question for Spectre... do you think it is enough if the 10mm spars are only inside the fitting by 1 inch (25.4 mm) ? If it needs to be more, the diameter of the fitting will have to be much bigger, OR some other alternative.....

If 1" is okay, the fitting will have a 2.75" diameter and have a thickness of 1". Yep, this is a big fitting.

-Steve

[QUOTE](#)

I don't think that 1" will be enough(it is 2" on my HUB). In the high winds the force is to much on the center. I also insert 8mm fiber inside the 10mm spar on the center.

My HUB is made of wwood and plastic tube. I used 3mm wood.

Between two circular wood,there is vertical woods and between vertical and horizontal woods there is plastic tubes(12mm outer and 10 mm inside dia).

Best Winds,

[QUOTE](#)

Hello Ferruh,

I understand the spars in your kite go into the hub 2 in. What is the diameter of your hub. Also you incert a re-inforcement rod in the bottom end of the spar, how deep or long is the incert. have you experimented with a two peice spar having a 10 mm at the center and a smaller size half way out. Is there less force on the spars towards the outer circumfrence.

Regards  
CLIFF

[QUOTE](#)

The Diameter of the HUB is 13.5cm more then 5". and I used 7.5cm/3" insert(8 mm carbonprince) at the bottom of the spar.

I don't test any other configuration. I didn't want to risk the spars because there is no kite material source in Turkey and buying spars it too expensive becfause of shipping and taxes. But if you want you can try different alternatives.

My system is working very good I test this up to 25mph.

Best Winds,  
Ferruh Baysu

[QUOTE](#)

I am starting to get orders for this fitting! Guys, we are having a bit of a problem... The largest size plastic we have is 2.75". At that diameter each spar will only go in about 1". If we need the spar to go in 2", the plastic will be 4.75" - that is no problem for our indexer, BUT, the largest diameter our lathe can accomodate is 3"... and three inches gives us only and extra 1/8" insertion.

The price for a 2.75" tinkertoy with 10 holes will be around \$8.00.

Another option is to use the 2.75" plastic, but drill the holes bigger to accomodate a 2" aluminum ferrel that fits the 10 mm spar. That way the spar will go into the ferrel 2" and the ferrel will go into the fitting 1". The biggest issue with doing it this way is cost. The tinkertoy stays at 8 bucks, but the ferrels cost \$2.00 each. So the fitting would approach \$28.00, PLUS there really should be a ferrel for the spine going though the center of the fitting..... bringing the total cost to \$30. Kinda pricey, but then... this will be a big kite worth at least \$1,000.

So..... Its your choice. Take the \$8.00 without the ferrels if you think it will be strong enough, or go for the beefed up \$30 version.....

In either case, you might also consider adding a 3" internal ferrel inside the 10mm.... use either the solid or hollow 8mm (.2810")

Also note, the fitting will be made from UHWM, which cannot be glued, so if you go with the bigger option, the aluminum ferrels will have to be glued to the spar.

My personal gut feeling is that the 1" insertion without the ferrel will be okay.....but..... I never made this kite. No gaurantees if you go this route. Heck, there are no gaurantees if you go the other route either! 😊

Any other ideas?

I guess we could buy a bigger lathe? 😊

Steve Ferrel

well stevef I for one will be using that 30 dollar center piece ! So for those that wanted to know what MM was going to use ! that is it ! I have ordered mine and took the liberty of ordering one for bill wilson also ! Want it to be good ....yes all the material is ordered and now I will have to sit and wait ! my patterns are drawn and cut ready to put on the ribstop ! it will be a impresive kite for sure ! 😊

I didnt know that could be done! When I asked the old man, he said he knew it but resisted the mention because it is a real pain to turn them around then put it back together again with correct alignment. But I convinced him the forum group was worth the effort - so..... I am purchasing some larger UHMW. The largest size we can now work with is 5" and this will give us 1.9" insertion. However..... big plastic is expensive and the final cost of the fitting will still be around 30 bucks (including the extra Aluminum ferrel for the spine), but it will be a cleaner look and definetly strong enough. If anyone else is interested, please let me know as soon as you can so I can have the old man make enough before he turns the chuck around again. (no need to order or purchase now, I would just like a guestimate of how many to cut).</p> <p>-Steve</p> <hr/> <p><b>Steve Ferrel</b>  <b>Kite Studio - Go Build a Kite!</b>  Measure once, buy twice! </p> <p>Last edited by stevef on Fri Apr 02, 2004 1:52 pm; edited 1 time in total</p> <div> <div>PROFILE</div> <div>PM ME!</div> <div>E-MAIL</div> <div>WWW</div> </div>

building of a double star is about to begin! I will be posting here regularly as I put this kite together ! I will encourage all the other 5 builders to chip in and post pics of their progress also! I know of at least 5 that intend to build it ! so here in Atlantic Canada there is Bill and myself ! then there is Gary and also CJQ (Clive) and SteveD said later this summer ! But all are welcome to chat with us as we go trough this process ! We are a big kite family and lets keep it that way ! I will be receiving my material same with Bill sometime next week!

here is my pattern pieces cut in poster board and ready to go!

now have not yet seen the need of using other material for patterns ! but never had that many pieces to cut ! will see 😊 😊

each section is identified with the number of pieces to be cut !

now I have heard from good source 😊 that Clive as already got his material and is mostlikely cuttin pieces as is ! Hope he will now find time to post here what he as done 😊

this will be a very impressive kite and im sure we will have all different color ! it will be a fun project !

Hey MM,

Well done! I guess I have to get my butt in gear... I am in the middle of building a 6ft Rok for my company.. So once that is finished, probably by Sunday or Monday, I can start on the star.

I am still having a hard time picking colors but I keep coming back to Spectre's original colors as being so beautiful.. so I think I will use Yellow, Yam, Orange, and Black (I may substitute the black for Red.. we'll see.)

Looking forward to getting the parts...

--Bill

At this point in time I have cut the fabric for the front section .That represents 60 panels. As I may have mentioned to you I hate to fold the fabric over and sew an edge. What is easiest for me is to edge bind ,and i'm doing that in the same panel colors . I have prox 25 panels ready to join together.The first thing I will do is the core sewing,To form the spine pocket . I will put two 3/8 in grosgrain loops oposite each other for the spine tension. at the pocket edge.</p> <p>I had a concern about using pockets at the outer tips . the fabric tapers to a point and the pocket needed for a 10mm rod is massive .Initially thought of using a peice of 200lb dacron sewn into the tip and thru a sloted cap. Now I have my doubts about that .But for sure I dont think pockets are the hot setup.</p> <p>MORE TO COME</p> <p>Regards CLIFF</p> <div> <div>Back to top</div> <div> <div>PROFILE</div> <div>PM ME!</div> <div>E-MAIL</div> </div> </div>

DID you study the joint sewing diagrams ? I.E. sewing a to b, b to c, ect. ? are you going to hot cut the fabric to keep the panels aligned for your sew.? Getting back to the tip pockets that were suggested , the outside panel gets quite narrow out at the end , I had thoughts about strength. I was trying to equate the 10mm rods to the fabric size and wondered if the cloth was strong enough or if the rods were over sized ,but then I think about the size of the entire kite and say it all makes sense. Since its been done before it must work. Some people have a tendency to under size some tend to over size , I tend to undersize. Today is picture time and some sewing Plus maby a short knap.</p> <p>Regards , CLIFF</p>

You could us a fitting similar to steves Rose Tree fitting if you used the grommet technique...

Hey steve are you mass producing those fittings yet? 😊

Cheers,  
 Bill

[QUOTE](#)

Just thought I would pass on an observation I made regarding the fabric layout for the star .Spectre gave us a layout method that would minimize scrap . However there is a trade off. If you are not overly concerned with a little waste sque the templates prox 10 deg. that will put the fabric grain in line with the tension created by the tips of the star. It may not make a row of beans one way or another . I didnt think of it until I laid the panels ene to end . The most important thing is to be consistant with the grain direction on all panels.

Will post again

CLIFF

Have not had problems with other kites using the pockets similar to this to date ,but of course cannot be positive re the Double Star until we try it!

Hi bernie did some more thinking on your adjustable pocket . good design for the application . the pocket will be oriented front to back when mounted and will equilize when the front and rear assembles go under tension. thats a good thing. The two tips sewn together as a pair from either section should equalize also. The pair sewn together must be of exact same length so they both recieve the same tension . My guess would be your pocket will be fine . I took a different approach, I first thought that sewing in a 200 lb dacron line in the tip would be the hot setup, However , after thinking some more I decided to use a grossgrain re-enforcement with a triangular attachment point .This triangle is my foundation for a number of different attachment methods. I think I will use an end cap that will stay with the kite sail . Doing that will make setting up the kite each time go easier. Each of the 4 tips will have a fastening line with knots precisely spaced that will be in slots in the end cap. Once the kite is initialy assembled only infrequent adj. will be required. Moisture causing fabric strech must be compensated. This kind of a kite requires nece tight sails for good flight. The other way to achieve tension would be to increase the distance between the front and back sails with the spine loops ,but, if spread too far sail deformation may occur. Well , thats enough for now just wanted to pass this on .

Here is a picture of the star tip I made from scrap. The grossgrain is 3/8 in wide. The triangle I made and its 14 ga formvar coated copper with soldered ends.

Regards,  
Cliff

[QUOTE](#)

Yes, Mountain Man, it is a very good idea. Also it will work fine in the future to tight the sail.  
Cut the frames a little bit longer(1cm longer). In the future the fabric will stretch. So you can tight the sail very easy in the future.  
I am waiting for your flight test. If it works fine, I'll put your idea in my plan.

Best Winds,  
Ferruh Baysu

Thanks of the star \*grin\* but I have to clear up ! Gary is the one that taught me how to make the velco pocket ! Its in is Rok plans ! Thanks Gary!

I learned how to make the Velcro pockets from a Premier kite that I had purchased. Do you suppose THEY got the idea from Gary, too? 😊

Bummer, I can not see the photo of the tip attachment that CJQ is planning to use. 😞

[QUOTE](#)

Promised i would do pictures over the weekend I did now I must learn to post them myself . My wife was doing my photo posts but now she said its about time I learn to them . Is that insubordination? So I will try Dont laugh.

Now all 70 panels are cut and edge bound and ready for sewing . Spectre has a dwg. of the center section sew , but no dimensions , I just finished a second mock-up with scraps to determine what dimensions were needed to creat a reasonable size hole for the spine .I ended up with a center hole of 3/4 in. with these dinensions=== I applied a 1/4 in double stick tape along the inside edge of the "a" panels I also put a washable pencil line parallel to that edge 3/4 in in . Further I found the center of that edge and put a mark across the 3/4 in line on both sides of the fabric . This mark keeps all your panels aligned before sewing . You may wonder why I used the double stick tape ,It does two things for me It makes sewing easier cause I dont prefer hot tacking and panel alignment is quite important,and I think the tape offeres some joint re-enforcement.

When you get all the 10 panels held together centered properly the will look like they are mis-aligned ,they are not . You can connect all 10 together make9 sews close the loop then do the last sew . Good luck.

If you have a question fire away.

[QUOTE](#)

HI Bernie For got to mention I sewed in two grossgrain loops 180 deg. from each other with triangular loops like in my previous post. And to your question no I did not use any insg. cloth to re-enforce. I thought about the stress and concluded that if I do good sewing and all the sewing locations ( at the joints ) are Exactly the same distances apart at all the cross locations the stress should be uniform all the way around. That is the theory. Wether I make that happen is a different story ,say!

[QUOTE](#)

Monday we received from Stevef our order of [Ripstop](#) and tuesday started the tracing then cutting of material ! then we did double fold hem on the first 20 pieces which is the center ! here on our kite that will be white !   
then we sewed those 20 pieces to form the center and added a dacron reinforcement pieces on 2 pieces that will be across from each other and will serve two purposes ! one as anchor point to tie the harness and Second to attach the line to hold the arrow nock pieces !

here showing A pieces sewed together !

Now folding the double hem for the B pieces here those will be Raspberry ! very nice red ! now there is 40 pieces of those to hem ! lots of work ! we will continue to post pics as we advance !

Cliff your pictures? 😊

I know that is awful since your picture poster as resign on you ? \*grin\*

Ya it comes from the angled panels and the folding of the joints . I had the same problem ,I kind of centered the adjoining two panels and sewed. I dont think it makes a difference at all. I was out to stevef's yesterday and the rods are not in yet but very soon . Tony is well into a prototype mock-up and soon be making what we need.Tomorrow I will be sewing panels C to D .I'm getting nervous about getting the panels all sewn with equal lengths between the sews. We dont find out until we put the fabric on the frame. What colors are you changing? W ill it be white red orange black?</p> <p>CLIFF</p> <div> <div> <div>PROFILE</div> <div>E-MAIL</div> </div> <div>PM ME!</div> </div>

well it will be a while so you will have yours finished before I get the rest of my stuff! The new colours are

white rasberry dark rasberry blue have a choice of two blues but have to see the dark rasberry and put the two blues to see wich one I will use !  
dont want to cut the blue and find out it wont go with the dark rasberry !

so will just work on something else in the meanwhile .... when are you going to put pics?????? Cant you bribe your better half in putting the pics up for you 😡 .... I want to see ..... 😊 or have you put some up and I missed it ? any where else??? curious mind .....ok very curious ...I admit .... 😊

Now I could cut the the D panel in the blue that I think I will use ....but what if its the wrong one ..... then I would have to cut pieces for a new Double star ....using new colours for A B C .....No I better not .....cant afford it \*grin\*

[QUOTE](#)

Well Burnie , I got thru phase # 1 I posted some D.S. progress photos in Notebook . Now I must figure out how to get them into this column. But in the meantime look at them there and ask me some questions . I tried to show some of the things you discussed previously. You will note I am using only two colors . The color scheme photo shows the flower effect grafic patern. It turned out that the picture with the color outline became important when putting the panels together . What a nightmare . At the Cto D intersection colors criss cross .Some intersections have similar colors some are mixed. Your grafics are perheps a little different and easier. Have a look and let me know.

[QUOTE](#)

Hi Bernie , boy you are quite observant . Yes , the D panels will not be sewn together at the tips . Last minute plan change. At first I thought I would sew the adjacent tips together ,However further thought occured and I decided to sew in triangle loops on each tip, the purpose being it would allow for additional adjustment between adjacent cells . I will attach a line from one tip go thru an end cop and down to the adjacent tip. At that tip I will loop thru the triangle and tie a tensioning slip knot .The name of that knot slips my mind But, I believe 10 not experts will respond and remind me . EH.

Did you take notice I covered the grossgrain with the same color fabric.

Wow only one question Must be good pictures .EH.

BTW Stevef you suprised me when I saw the Proto-type I made Scared the hell out of me ,cause I didnt remember posting it Thank you for the credit.

[EDIT](#)

Wow, I never thought that asking for plan for this beautiful kite will end-up in a thread over 14 pages 🙄 .

I'm glad to see all these peoples building this kite. Now my mind keeps telling me to start building one. 🤖 It's climbing its way up in my todo list.

I was trying to visualize what kind of pressure the tinkertoy is submitted to in the wind. Which direction the spars will compress or pull on the tinkertoy? Anyone can answer this?

Smarties 😊

[QUOTE](#)

Hi Smarties, It is amazing how many people got hooked on this star. Thanks for your efforts too. Your question about the stress on the tinkertoy has been considered . We are following the plan that Spectre has put into practice and he claims that the design will handle winds up to 25 mph. Thats a bunch of wind . The amazing thing is there are three bridle points at 10 , 2 , and 6 oclock .The bridles attach to the 5 ft. 10 mm. spars , those three spars carry the load. The amount of stress transmitted to the center hub will not be excessive. Certainly the core section has the most sail area and creat the most force but that force will be distributed to the outer tips . When you look at the front and rear sections from the side you will see a triangular profile caused by the prox 10 degree pitch in the sail panels .Anyway thats the theory The important thing is Spectre says it works.

I posted some pictures in the notebook this A.M. showing some construction . This evening I finished sewing the first section , got so excited I took it outside and layed it out on the ground for pictures , wish the heck I had some 5 ft rods to assemble the thing, oh well cant have everything.

Here is the pic.

EDIT

Thanks CJO for the information. I had a few ideas on making my own tinkertoy. It's still boiling in my brain 😊

Your star is taking shape. I like your choice of color. Keep us posted.

Smarties 😊

Sounds like you cant sit idle. I see the velcro strips ,what are those blue peices of fabric used for. I cut all the panels for the second section . Also cut edging strips for half of them ,so the work moves on . Its still a long way to the end . I'm realy bummed out cause I would realy like to have rods so I can mount the first completed section , wish I could build a fire under stevef's supplier.I guess when you get old your patients goes away. Keep us posted on your progress.</p> <p>CLIFF</p> <div> <div>PROFILE</div> <div>PM ME!</div> <div>E-MAIL</div> </div>

Those are the insigna cloth! its dacron with glue on back ! I will use one on each side of the tips then the velcro pieces sewed in between to form the Tip that is adjustable !

so the pieces ends are sandwitched in between the Dacron then sewed! 😊

hope that help ! will put pictures when I get to that stage!

[EDIT](#)

Hooo MAN 🙄, we're not done with one challenge that more keep coming in. It's gone take several generation to go through all of them. 😊

This kite looks very different, interesting, wow, and all the other words I can't thing on a Monday morning before coffee. 😊

Is it basically the same structure as the double star but about 8 times instead of two?

Smarties 😊

[QUOTE](#)

Yes, Grant they are the same kites.  
Now I remember that the picture you post is from Indoor Kiting Show(Holland). Here is the link.  
<http://www.home.zonnet.nl/redbaronkiteteam/dra03/dracht03.htm>

and a small picture with the purple panel on the back.  
<http://www.fryske-draeken.nl/fotos/Foto~6s.jpg>

Henk told me that it is to hard to construct the all three parts, so generally he flights only 2 parts(Green and Red).

Best Winds,

[QUOTE](#)
[EDIT](#)

A few months ago, I bought a book on kites written by Jean-Philippe Ritter. In his book he shows how to build various classic kites. Very good book, but in French.

He has a simple way of doing a "tinkertoy". Because of copyrights, I can't post a copy of the page but I will try to describe it.

To build the "tinkertoy" of an hexagonal kite, he uses a piece of plywood (1/4" or 5mm) that he cut in a hexagonal shape (6 sides). Then, from each corner towards the middle, he cut, with a jigsaw, a slot about 2/3 of the radius and the width of the tube that will hold the spar. At the end of the slot, he let a little bump that will end-up inside the end of a piece of tubing to hold it there.

[Sketch](#)

He then inserts an aluminium tube in each slot and tie it down with a piece of wire close to the entrance point. The tube sticks out about 1 inch. Then he poured epoxy all along the tubes on each side. The spars can then be inserted in the tubes once the epoxy is dry.

Anyone followed me? His kite was just about 5ft diameter (160cm). I'm not sure if this method would be strong enough for a larger kite but I thought it could trigger some new ideas.

[QUOTE](#)

I got it!!!!

Simple yet elegant...

I still prefer the Kite Studo Tinkertoys as I realy LOVE machined plastic parts, but the plywood version has great merrit.

if the tube that he epxoyed into the hex was the same OD as the thickness of the plywood or less, you could epoxy another piece of wood to hte outside of it to add strength, but more mass.

or add more holes and more wire to act as whipping.

Add Microballons to your epoxy to reduce its weight wihtout decreacing its strength.

Be sure to corse sand the outside of the tubes to give the epxoy more surface area to bond to.

VR/

[QUOTE](#)

Yep I agree with harold ,has lots of merit . I would prefer epoxy but a type that we have down here called J-B WELD ( brand name ) or one called P C- 7 (brand name) found in places like home depot ECT. The products are two part mix 50/50 , The material is thick paste . When cured you can grind it drill it ,tap it , and its good to bond almost anything except teflon type mtls. It makes good fillets in corners. Just thought i'd pass this on. Dont know if stevef has any .

Your wife must really love you to let you set that star up in her kitchen.  Can't wait to see the finished product and see it flying.  Good winds....Charlie

The Star is on the middle burner right now. I just mentioned in whats on your mind that i'm working and filling in for a vacationing employee at my sons place of business . I'd rather be building kites . The Star is coming along the first section is finished just like Burnies . The remaning 70 panels to make the second section are all cut and edge bound. the tips of the star now have the triangular loops sewn in . The nylon adjustable end caps for the radial 10mm rods are complete . All I need now is some time . This weekend looks good .YES STEVE, you can post the pics. that you took of the star on your front lawn . You know it is a difficult thing for me to do .eh.</p> <p>Bernie you beat everybody again with the biggest and bestes. Good for you . What will you call it ? I havent named mine yet .</p> <p>Hey anybody , Who's making one of these stars??? Let me say this is one great kite .Its not a difficult kite to build all the sewing is straight sewing.</p> <p>I did some calculations on how many yds. of fabric I think its maybe 10 to 12. Very little waste . When its done the kite would be worth many hundred dollars . but the important point is its bueatiful and unusual and you can be a proud builder. I saw a post showing a picture of three in the air and had serious thoughts of making two more. Kiders are crazy ,Well maybe some.</p> <p>Regards</p> <p>CLIFF</p>

They are light blue and dark purple . What is different is the grafic design . The center core panel #1 is purple and then the colors alternate and form the grafic into A flower pedal . There are 5 blue and 5 purple pedals . the only pictures now stevef took and he said he would post . But the pics. are only the front section thats finished .</p> <p>Bernie is the master of speed and beauty ,however we are all going to catch up to him. Some day!!</p> <p>Regards</p> <p>CLIFF</p>

here is assembling of the double star my way 😊 I say that cause I might be the only one with that system !

pushing spars one at a time !  
now showing the spar in the tip casing

now closing the tip! 😊

showing the top of the kite .....

a side view !

looking like a flower ... the kite that is

3/4 view of the kite still have to make the harness ! hoping to fly tomrow !

I dont remember if I had mentioned that when I set up the front sections at steves the 10mm rods were a little short for me. Probably the way I made my jounts. Rather than peiceing and glueing extensions on each rod steve ordered 10mm rods at 5 ft 3 in long. thatshould do the job for me . Oh man I am as thrilled as you about tomorrow. This will be the first Double Star flown on the North American Continent .YES!</p> <p>CLIFF</p> <p>PS. Smarties you better show up tomorrow and get some pic's. also . Tell your wife this is a momentis occasion that you cant miss. eh.</p>

[QUOTE](#)

MM is right.

The tow point of the bridle will be 5 and 7 o'clock(bottom of the kite). And the third one is top of the spine. If the wind is too much and kite pull too much move the bridle a little bit up. The kite can fly with one point bridle. But it flights too low with one point bridle and wants to rotate.

I hope this photo helps you.

MM, we are waiting for the pics.

Ohhhh I think I made a mistake when showing the bridle, I wrote center spar, it will be the spine. I'll draw a 3dimensional drawing of the kite. And make a more detailed description.

if you look in Into the Wind's 2004 catalog you will see the Lotus on page 34 or I am sure you can find it on their internet site...

Theirs is a 4 and a half foot size for \$55....

I dont know who manufactures it for them as I cannot find it at Go Fly A Kite, Premier, or New Tech's web sites.

This is such a cool kite in the air, and it makes a great noise when you are standing near by... the wind hollowing through all of the facets is very very cool.

You could see it from very far away and attracted a few spectators 😊

WELL DONE BERNIE!

Yes, smarties. You are the quilty. Everything began with you.

I was in holiday when you submit and the drawings of the kite is resting in my harddisk. 😊 Thanks to you, to submitting this subject.

Steve, I am very happy that my plan works well. I don't have a good english, and I am not a very good kite builder and also this was my first detailed plan. I was very worried about the plan work well or not. Now I see that everything is ok. But I'll add some three dimensional drawings to plan and also I want to add the pics from MMs and from others projects if they are accept. Because there is some alternatives for the end pieces.

QUOTE

Marc,

I think it changes which colors are you using. I used orange(Panel B) and Red(Panel C) . They are similar colors but in the air orange seems more prominent, may be because of orange is more bright. It is the same in the sideview. When you look at from side, the red(C) seems more but the orange(B) more prominent.You can look at my kites sideview. <http://www.ucurtma.org/images/mykitebag/starbox/002.jpg>

I used a black on D to give a boundary to kite. But lots of peoples used white or lightblue. You know the color combinations of Bernie and Cliff.

Also you can use more than one color in panels. You can make same color more than one panel for exaple one and a half.

there is some other color combinations.

The kite does require a lot of material. I 've assembled parts A and B, and have just started cutting out part C. You probably need at least 15 yards of material for all 140 panels. You might get by with a little less if you can cut out all the panels as efficiently as the one picture showed. I allowed a little waste around each panel to make cutting a little easier. I'm probably wasting about 1/2 yard per color. That said, I've never used <a href="#">Design Master</a> paint. How many yards of material can you paint per can of the paint? Make sure you have enough before you get started spraying.</p> <p>Ray Bojarski</p>

The only concern I have with the paints is the sail becoming opaque. I wanted to have the sun shine through but was not sure if, even light coats would make the sail opaque. 😊 I thought that the white wouldn't need much paint. I had planned on the colors blending into each other so I am not concerned with getting perfectly even colors.</p>

Hopefully we will fly our stars side by side when we get together. As for your question about the toray , I think it will be ok , the tension on the sail is determined by two things, the amount of tension at the star tips with the adjustable pockets and the wind force. Each can be controled , the latter by the attack angle.I also think that good strong edge binding is important, as the star tips come to a narrow point and the edge binding provides significant strength .</p> <p>grant glad your taking on the project ,it truly is a wonderful kite , very impressive in the air and a kite you can work while its flying . One of the neat things you can do is let line out to cause the kite to drop and when it nears the ground you pull on the line quickly to make the kite rise rapidly, the star sounds like a jet engine. The spectators love it.</p> <p>Talk to you when you get back, btw steve f and I are going together he'll probably ship your stuff when we get back on tues.</p> <p>Regards Cliff</p>

<b>Grant L</b> Kite of the Year 2004  Joined: 16 Sep 2003 Posts: 1507 Location: USA IN Indianapolis	<div> <input type="checkbox"/> Posted: Fri Jul 23, 2004 10:53 am           <span style="float: right;"><input type="button" value="QUOTE"/></span> </div> <hr/> <p>My computer died so I can't sit at home trying to figure out the color scheme, so I'm still getting my order together. One thing I am concerned with is the ability to travel with the kite, ( Five foot spars 🙄 , ) I wrote to Bernie and he said that the kite is heavy overall and you need to be sure it is sturdy enough for landings. He also thought that it was best to allow the center hub to move up and down the center spar. I was considering making the center spar 3 piece so the center section is clear of obstructions, ( with internal and possibly external <a href="#">Ferrels</a>.) and the horizontal spars 2 piece, ( with external and possibly internal <a href="#">Ferrels</a>.) I don't have any experience with this type/size of kite. Bernie stressed that the spars have to be strong. Any other advice/comments ? Am I better off just leaving the spars one piece and living with it ?</p> <div> <input type="button" value="PROFILE"/> <input type="button" value="PM ME!"/> <input type="button" value="E-MAIL"/> </div>

If you make the spars multiple pieces to shorten the lengths, then you still have to deal with rolling up all the material that makes up the front and back of the star. You'll either end up with a somewhat longish, fairly fat bag to transport the kite, or a shorter and extremely fat bag to hold the kite. Gathering up all the material for storage may be a problem if you have shorter spars. But that's. my thoughts. I have parts A, B, &amp; C all done and assembled. Getting ready to start cutting and making all the part D sections. So far its a hand-full wrapping up the two sections of the 3/4 assembled kite.</p> <p>Ray Bojarski</p> <div> <input type="button" value="PROFILE"/> <input type="button" value="PM ME!"/> <input type="button" value="E-MAIL"/> </div>

I made it two piece. So I can take out ferrule and carry it separately. And bag becomes thinner. I am cutting from the mid of the spar one piece is longer than the other one. Short part has the ferrule and the long one has a stopper.</p> <p><input type="checkbox"/></p> <p>In my opinion 1.5meter/5ft is not too long. I have 1.75meterspar/6ft spars. And I am also happy with them. I don't have any problem when carrying.</p> <hr/> <p>Best Winds, Ferruh Baysu</p>

Wish I could help you with the pdf stuff, but thats way beyound my brain. I took the (american ) template version line drawing and did a layout on some thin alu. flashing and cut the templates with a wallboard knife. All straight cuts and very simple. I rounded the dimensions to the nearwst simple fraction. You dont need a micrometer to cut <b>Ripstop</b> . Only thing you must do is be consistant. The panel inner edges are parrallel to the edge on the oposite side. Panel # 4 is 22.9 in. from the base . Panel # 2 is 14.07 in from the base. When I printed out the plan the 2nd and 4th panels were cropped for some reason ,maybe not for you .</p> <p>Wise decision to go with single peice spars! Need some help come on back.</p> <p>CLIFF</p>

Here is a new Doublestar made by Leandro from Brasil.

This one is a halfsize(1.5meter) and made by bamboo and paper.

Best Winds,  
Ferruh Baysu

[QUOTE](#)

Hi Ferruh, Thanks for the picture. Did you see the kite yourself? It amazes me that the material is paper . The joining points of the panels have stress in directions that cause extreme shear. I'm wondering how that was overcome? Can you comment. Was the hub made like yours? How about the pockets?

Wait for your comments

CLIFF

Hi Bernie,

I liked the way the colors popped out on yours and the way the colors were laid out on Cliff's. So mine is going to be red/white/blue ,( I know Kiteguy will like it 😊 ) with a white center and the red and blue in a pattern like Cliff's kite. I'm trying to find time to work on it around home and school activities. Going to get started cutting out the red and blue tonight 😊 Look for questions in the next couple of weeks. Ferruh was nice enough to send me some files so that I could print out the patterns out on 8 1/2 x 11 paper. I'll be glad to send them to anyone else planning on making one, ( Thanks Ferruh !)

[QUOTE](#)

I've been working on my double star as well, color scheme from center to outside - black - gold - white - black.

I've got the bottom half assembled, and I'm working on the top half now. The actual assembly of the kite is fairly quick, it's the cutting and hemming that was taking me so long - very tedious.

I'm hoping to have the kite done and test-flown by labor day weekend for the Beech Mountain kite fly in NC. I don't have a digital camera, but I figure someone may get a picture or two of it there.

well my way is a little harder to build but make it easy to adjust tension on the sails now cliff had to special order the spars as 5 ft was not long enough ! now I did not watch Cliff assemble his kite ! but with the velcro it makes it very easy to assemble ! now lets here Cliff comments 😊

[QUOTE](#)

When we came home from vacation a few weeks back, we brought home two suitcases 🧳 full of "KNEX" that my nephew gave to my four year old son. So I have been spending my free time building with him, ( we now have a small carnival in our living room that includes a roller coaster and a ferris wheel, ) and have had to do my cutting at night. But I finally cut out the last of the 140 main pieces tonight 🧐 ( and only one minor stab wound and no lost fingertips 😊 ) I am playing around with something that I can use to crease the fold lines so that I can speed up the process of folding all of the edges. I have experimented with a straight edge and a small, dulled chisel, using my cutting mat as a surface. Works OK but I'm still trying to find something that will form a better crease without damaging the [Ripstop](#). I hope to make lots of progress this week 😊

Back out of retirement filling in for one of my son's employee's. Thats the bad news the good news is that i'm shaking the money tree. Gettin some bucks for my AKA trip in oct.</p> <p>About the panel " D" tips. ,As Bernie has mentioned he used velcro pockets to tension the sails. I used grossgrain loops on the tips and end caps I made with slots for adjustments. However , since Bernie's and my kites were made some further thought has been given and a special end cap was suggested for that application. The adjustable end cap is in the kite studio catlog and its called theMKS endcap. It has a hole drilled thru the cap 90 deg. to the center line and a nylon set screw to afix a line that is passed thru the side hole . The recomendation is for a 200 lb peice of line be sewn to the panel tip . that line is then slipped thru the fitting and locked in place by the screw. VERY SLICK APPLICATION. I said it was a special end cap ,not realy , steve can make them up easily. I believe that Ray B. , Grant L, and canadian Bill are employing this method. Probably if bernie and I knew of the fitting thats what we may have used . The fitting can be left in position at dis -assembly , plus it allows tensioning of the front and rear sail individually. NEAT&gt;</p> <p>Hope this helps you marc.</p> <p>CLIFF</p>

[EDIT](#)

Looks like this thread will never end. 😊

I think this kite was a good exerceice to learn a lot and we're still learning from it.

Thanks to all who contributed to this thread. If I can one day flush my todo list, I may get to build one of these. 😊

Smarties 😊

<http://www.yvonhache.com>

To boldly go where no imagination as gone before! 😊😊

For example, if you want a 1/4 inch hem, put your marks 1/2 inch in from the edge of the sail. Depending on the size of the hem, 3 to 6 marks spaced somewhat evenly should be enough, Fold the edge of the sail over to meet the marks and press down with you finger to start the crease. After the entire hem is made, go back and set the crease with your finger nail to get a sharper hem. You can then run the edge of the kite over the edge of a table to help set the hem. Tape the hem in place with cellophane tape and then sew the hem. Works great for me.</p> <p>Ray Bojarski</p> <p>Last edited by rbojarski on Thu Sep 02, 2004 1:18 am; edited 1 time in total</p>

Not quite at the point in construction to see how these fittings work. I just started cutting and assembling all the part D panels. When I get all 40 made, I'll start attaching them to the assembled A+B+C parts of the kite. Depending on the weekend, I should get around to framing up the Double Star some time next week. Now if I can find some place tall enough in the house to put the kite together.....</p> <p>Ray Bojarski</p>

I use it now for everything. Hemming, making templates, marking various seam lines, everything. Wonderfull tool.</p> <p>The Della Porta class, stage three, has a good description of hemming. Step 3 and step 6. BTW, it was Kitenerd who convinced me to get a quilters ruler. I thank him endlessly for that 😊</p> <p>I use a combination of Ray's and Conklincomputers methods.</p> <p>Mark a 1/2" line in from the edge (quilters ruler). Fold fabric edge to line. Hold with one hand's thumb and forfinger. Use credit card to press fold. Do a whole side like this. Then fold over again, use credit card again. Viola, double fold. Quick, easy, and very even.</p> <p>P.</p> <hr/> <p>There is no box</p>

You will enjoy the kite when you fly it. We have 6 or 8 people who have made or are making one now. To my knowledge we all used 10 mm spars. The wind needed to keep it in the air is about 10 mph. I have flown the star many times and wished it would fly in about 7 to 8 mph winds. So I am doing an expirement and ordered 2800 dia Carbon spars. A 5 foot 10 mm spar is prox. 2.875 ounces. A 2800 spar is prox. 2.0 ounces. I believe my weight savings will be a little over 1/2 lbs. My concern was or is spar stiffnes. I shall see, and let you know. The spars should arrive within a week . If your just starting to make the star ,which will take a bit of time to sew(right guys ??) I will have the results by the time you get to framing. There is an incredible amount of posting about the D.S. to read, in fact this thread has more posts than any other topic in this forum. Guess its because its such an ausum kite. Hope you share your project with us.</p> <p>CLIFF</p>

And saw that the DS reply is going bigger. It seems this will never end.</p> <p>I am waiting for your news about the 8mm spar. But I don't know your spars are much more than which I used or there is something different. Because my DS can flight less wind. When I have time I'll weigh the kite. If you have time please also you check the weigh so we can compare. Did anyone tried to move the tow point up and down. I'll check my DS bridle again. It is possible that I made a mistake 😞. But on the pictures the angle of the kite seems correct. So this a very low probability.</p> <p>Probably 8mm will work on the less wind. My friend has one 8 point 2 meter DS with 6 mm <b>Carbon</b> spar. It flight less wind but when the wind goes more the kite begin to change its shape. May be you can carry two types of frame with you.</p> <p>Conklin, I like your black/orange color. What is the color of the orange and which type of Fabric. I put your pics link to my webpage. But I don't know your name and location so I can write only Marc as builder information.</p> <p>Here is a photo of my Doublestar in my eye.</p>

Best Winds,  
Ferruh Baysu

☐ Posted: Tue Sep 07, 2004 5:29 pm    Post subject: Marc's Super Double Star

[QUOTE](#)

OH MAN Great job Marc. The colors pop, good combination. Is it an ausum feeling to fly, or what!! Yee yow eee . Hey Randy are you ready to start one??? Hope Marc let you fly it a bit. Although it's tough to give up a new toy , hope he let you touch the line anyway. HA HA. Sorry you cant make the AKA. I know Ray B. will have his there. Not sure about Grant . His probably would will be finished , dont know if he's going. What was the wind speed when you had it up? As Steve mentioned Were waiting on the 2800 spars. Hopefully it will allow flight at 8 mph. which is a more common speed ,for me it seems. Will let everyone know.

Did you see the post by SHARKY who said he decided to make the star also. I think the intrest is generated by a few things. The kite shape is ausum. There are so many color combinations that can be used to create individualism . And I think many have decided to try thier hand making one because they feel comfortable knowing we are all here to help when problems arise. (it's the family thing) And last the KITE STUDIO is here to supply the parts we need --Thanks Steve!

CLIFF

Yes I have expiremented with the attack angle . I have a slider on the bridle to the center so adjusting is very easy. I change the angle to meet the wind strength. 10 to 12 mph is the range that will lift and maintain flight. I just weighted the kite. the 10 mm spars with the tip fittings are 2 lb./11 oz. the center hub alone is 6.15 oz. the sail is 1 lb/13 oz. the total wt . is 78.15 oz's. or 4.88 lbs. With the use of 2800 spars I will reduce the wt. by a little more than 8.0 oz.Hopefully it will allow flight at 8 or so mph. we shall see.  Thanks again for your help.  CLIFF</div>

As for demographic information, my name is Marc Conklin, I'm from Midlothian, VA, USA.</p> <p>I think that the weight difference between your original double star and the ones we've made here could be the hub. You made yours out of wood, I think we've all used the machined hub that the Ferrell's made for us (thanks! 😊), I don't know a lot about the material, but I'm thinking that it would weigh more than yours. All I know is, while the kite flies extremely well, and was pretty stable considering the bumpy air I was flying in, it's pretty heavy and would fall like a rock if the wind dropped. I was running up the hill several times to get it back up (to the cheers of Harold Ames!).</p> <p>I really wish I was going to Nationals, it'd be a blast to have a double-star mass ascension! Maybe I'll send mine with some folks who are going so that could be accomplished! How many double stars will be at the convention I wonder?</p> <hr/> <p>Marc 1/2 of Airborne Virus and RAF webmeister <a href="http://www.richmondairforce.com">http://www.richmondairforce.com</a></p>

[QUOTE](#)

i did buy the [Ripstop](#) for my DS today

the colours is going to be like the pic in the post that started this never ending story yellow orange red and black.

a friend of mine is geting the templates printed on a plotter so i get them in the exackt to scale. the reason for the choise of colours is that it was the best looking colourcombination i could make with the [Ripstop](#) my lokal kitepusher had in stock

[QUOTE](#)

Spectre....I knew the kite on ebay was either the lotus from Flying Wings, or a ripoff of their design. I bought a lotus a while ago. I just made the previous post to add a little levity to this thread. Sorry for the slight diversion.

Anyway, I have now completed one half of the double star. I have all the parts A thru D assembled and sewn together. I have grosgrain tabs over the D+D pieces like Cliff had done. The other half is assembled with A+B+C. All the remaining parts D are finished waiting attachment. I haven't inserted the radial spars into the center hub to a test fit for necessary spar lengths.

I slipped the completed sail over the center spar, which brings up several questions:

1. About how long should the center spar be? Right now it is the full 60 inch length. Is this close to the necessary length or does it get trimmed substantially?

2. I added small tabs at the back of the assembled parts A. The intent is to put a loop around the pieces which hold the center hub in place, so I can tension the half of the sail back from the end of the spar to the center hub. Is this a good idea?

3. How do you wrap this whole thing up for storage? I tried rolling up the completed half, with out much apparent success. How big around should the bag be to store the kite?

There were other posts above about cutting down weight on the double star so it would fly in lighter winds. Would using icarex (or the equivalent .5 ounce material) be a better alternative to thinner walled rods and a lighter center hub? I guess I've used about 12 to 15 yards of material for all the 140 panels, plus edge binding. How much lighter would the kite be using 12+ yards of .5 ounce vs .75 ounce fabric?

Thanks,  
 Ray Bojarski

My center spar is 150cm long. With the arrow knocks it goes 151-152 cm. It must be it this length because the kite has 150m depth plus 1-2 cm(.5inch) for the pockets. So 59.5-60inch is fine. But you must decrease the length of the other spars because of HUB (in my HUB this 2.5cm - 1 inch). If you will not use pockets, the length of the spars will be longer than the others. I recommend you not to cut the frame until you finished the sail.</p> <p>The Equation must be        Lenght=150cm-HUB's space(Center to the beginning od the Spar)+Length after the End Tips        And add 0.5cm or less for a mistake. You can easily cut later this part.</p> <p>2. Some of our kite friends are doing like that, but in my plan no need to this. I try it and take no change. So now I am using without tensioning.</p> <p>3. 151cm(60inch)-12cm(4.7inch) diameter.(The bags around is totally 38cm(15inch). But I am taking the GUB and carry it in another bag.</p> <hr/> <p>Best Winds, Ferruh Baysu</p>
<p><a href="#">Back to top</a></p>	<div> <a href="#">PROFILE</a> <a href="#">PM ME!</a> <a href="#">E-MAIL</a> <a href="#">WWW</a> </div> <div> <a href="#">MSN</a> </div>
<p><b>spectre</b></p>  <p>Joined: 11 Nov 2003 Posts: 114 Location: Ankara, Turkey</p>	<div> <input type="checkbox"/> Posted: Thu Sep 09, 2004 3:10 am       Post subject:       <span>QUOTE</span> </div> <hr/> <p>Hi,</p> <p>I saw that every doublestar maker has a problem with the weight of the kite except me. The difference is come mostly from the frame of the kite. The avia uses a thick walled spar. Which are 40% more weigh than my 10mm. CJQ writes in his post the frame weighs 1219 but when I checked avia's site the weight of the frame and saw that it must be 908gr+endcaps +insertion. And I think this is less than 1000gr. There is 200 gr difference. So difference with the CJQ's frame and mine is 16.5oz(469gr). I think this comes from the <a href="#">Carbon</a> manufacturers difference. May be my10mm spar has same deflection with avia's smaller dia spars.</p> <p>I just looked at kitebuilder. Steve have 10mm, 9.5mm, 8.7mm and 8mm.        9.5 mm is already %11 weigher than my frame but %19 lighter than avia 10mm.        8.7 mm is thin walled. This must be the lightest frame but there is no information on Avia's site. According to my calculations this frame must be %30 lighter than my frame and %49 lighter than avia 10mm. I think this is not a suitable one.        8mm is also has a thick wall than my 8 mm. This is %14 lighter than my frame and %38 lighter than avia 10mm. This frame has a outer dia of 0.315"(8mm) and 0.232"(5.9mm), in europe this is 7.9mm and 6mm.</p> <p>You can see that 9.5mm is %11 weigher than my frame and 8mm is %11 lighter than my frame. It is possible 8mm will be OK for Avia. Also with 9.5 mm you can gain more than 86 gr/3oz.</p> <p>The second weigh difference comes from HUB. I have a wooden HUB. So this is nearly the half weigh of yours. You can reduce the weigh by reducing the dia of the HUB 1cm/.5 inch.</p> <p>If anyone take a chance to try different frames and HUB dia. Please tell me so I can tell about this on my plan.</p> <p>☹ Sorry about the 10mm recommendation, I don't know before that Avia's frame is to heavy. I think that all 10mm are nearly the same weigh but there is lots of difference with European and Avia frame. ☹</p> <hr/> <p>Best Winds, Ferruh Baysu</p>

EDIT

Wow, it looks like a Christmas decoration. 😊😊

As this thread keeps going, the pressure is going up for me to build one. Now that I have a sewing machine, the only thing stopping me is time. Maybe this winter during a snow storm. 😊

Smarties 😊

<http://www.yvonhache.com>

To boldly go where no imagination as gone before! 😊😊

Finished 3d drawing and panels. On the picture there is 7 steps but I made 6 steps.

But what will be the size? 3 meter or bigger may be 4 meter.  
Now need to calculate how much fabric I need and colors.

Steve I think I need some more fabrics. Because I bought red and white to make a kite white national colors.

[QUOTE](#)

Bernie, you may be right. I wil make one two learn which is nice.  
The kite on the pic has 7 step and DS has 4, and I 'll make 6 steps and a litlle bit bigger 3.2 or 3.5 meter. So it will be not so dense as on the picture.  
Now only problem is for me is the color choice. I ordered some white and red fabric from Steve two make a national colored kite(a big pyro delta). May be I can do a national color DS.

Best Winds,  
Ferruh Baysu

That is very cool! 😊 How easy is it to change the color on each drawing?

Smarties 😊

This is really impressive. I think we should orginize a double star festival.

Ferruh we hope you add the 12 point ds plan to your site.

I had bought my mid connector from Germany but i think they have no 12 hole connector. I think this connector cam be made of Delrin ( a similar material to teflon but much stronger)

Istanbul/Turkey

is there enough clearance between the two stars and hub to add two things inside, around the spine, that rotate?

CLIFF

yep.... havent made a prototype yet, but I am sure we can do it with the same 5" Hub..... we will just reduce the insertion so as to accomodate two more holes around the perimeter.

THE BIG ONE <a href="#">QUOTE</a> <hr/> Hi Spectre, which grafic patern did you decide to use ? the sprial or the step color design? Do hope you finish in time to fly next sunday. I would rather see the star than the pyro, soooooooo put the pyro aside and finish the star O.K. ??  CLIFF  P.S. Got the new 2800 rods for the DS 10 point . the weight reduction is 10 ounces. the hub was reduced by 2.15 ounces for a total of 12.15 oz.or 3/4 of a pound. Hopefully that will get me close to the 6 to 7 mph. wind range . we shall see.  Regards  CLIFF

If you want I can send you the drawings of the 12 point DS. But first I want to test its flight.</p> <p>I'll make the spiral one. For a long I want to make a kite in these colors. I'll make my DS 3.4meter dia. So it will be bigger than 10 point DS. I am buying frame 2meter long so it is no problem for me. But If you want I can sacle down the kite to 3 meters.</p> <p>Please tell me what format is suitable for you. If autocad is ok. I can send you also the 3D version so you can colorize the kite.</p> <p>I am waiting news from you about the new frame. If you can time and good wind condition, Please test for low and high wind.</p> <hr/> <p>Best Winds, Ferruh Baysu</p>

<b>kiteguy</b> Kitebuilder of the Year 2005  Joined: 15 Sep 2003 Posts: 3196 Location: USA - Kansas, Overland Park - Near Kansas City	<div> <input type="checkbox"/> Posted: Sun Sep 19, 2004 11:52 pm    Post subject:           <a href="#">QUOTE</a> </div> <hr/> <p>Sharky, that is a good idea on small scratches at the fold line. As you said, it may weaken the material a bit.</p> <p>However, when I make seams by sewing the material 1/4 inch apart, then folding the edges over and sewing them down creates a weakened line where I sewed first. Seems it would be quite a bit weaker, and under a lot more stress than when the weakened area is inside a hem. And like you said, there is no stress there, except parallel to the scratch line. That should be no big thing at all, I would think. 😊🤔</p> <p>I think I will be doing some testing, too. Thanks for sharing, Sharky. 😊</p> <hr/>  Dave Ellis Kites + Kids = Education

I was lining up the sew lines like the rest of the pieces, and ended up with the pieces each being about 4mm lower than the previous, rather than all in the same line. When sewn correctly, you get a bunch of small seperate poynys sticking up rather than the edges all in line. Hopefully lots of progress this week. 😊</p>

QUOTE

Hi Sharky , just hold up a little we will help you with the alignment of the A panels. Spectre step in and add your directions also. Sharky place all of your A panels with the outer hem to the left and the base at the bottom. The outer hem on the front section will be called the leading edge. Now the left corner at the bottom of each panel all will be sewn with the tip or lower corner aligned with the panel above. And the next and the next and so on . Just imagin that when you go around in a circle that you must make a perfect cylinder. If the panels are staggered when sewn to each other when you close the cylinder (or pocket) on the last sew the pocket will be distorted and the seams will be a spiral like in a gun barrel.

Hope this explanation will help, and not confuse you more. Grant did you have the same situation ??How did you do your alignment?

CLIFF

Hi Sharky,  
I started out sewing the pieces together like [HERE](#) in the Della Porta project. The problem is that each piece ends up a little lower, ( like the right piece in the middle diagram.)

I switched to laying out the pieces on my cutting mat ( which has a grid.) You could do the same thing by just drawing a horizontal line on a light surface, ( so that you can see the line through the [Ripstop](#).) then I make sure that I line up a certain point on each A piece with that line when I tape them together to sew. I used the bottom left corner of piece A ( looking at the piece with the edge that will be sewn to B on the right and the piece slanting down to the right.) When I join two piece A s together, I line up the seam line vertically and make sure that this specific corner of **both** pieces is lined up with this horizontal line, ( even though one is face up and one is face down.)

If this still doesn't make sense, maybe one of the "Graphic Capable" members can make a drawing. Hope I haven't made it more confusing 😊

Hi, here is my new 12 Point DS

Sorry, this is not the original frame and there is no HUB, because of this the sail is not symmetric and tight.

[QUOTE](#)

Hi, again

Yesterday, I take the spars and HUB. But there was gusty winds. I don't want to break the spars in first flight so I just launch it and look how it is seen and I want to see which corections I must do.

First problem is that the bootom bridle points are too close to each other. I'll move one of the bottom bridle apart from the other. Second problem is about the spine. It bends to much so I'll insert a long 8 mm [Carbon](#) spar inside it. This is for 10mm European spar not avia.

And here is some pics. I have some more but I can post them when turn home.

Went to a kite festival this past weekend and flew the d.s. . Actually flew with the new down sized spars. One of the events was a Peoples Choice Award Competition . Not realy Hi Tech. Traveling down the boardwalk through out the day were hundreds of spectators , on sat afternoon there was a competition for all hand made kites . the builders brought their kites to the boardwalk displayed their kites ,over a mic. explained the makings to the public and then flew their entrys for judgeing. The Double Star was chosen their favorite choice. Yes indeed I was a happy camper!!Got a gift cirtificate from the Kite Loft on the boardwalk and immediatly cashed it in for more kite stuff. The KITE LOFT by the way is owned by people who believe in giving back to the kiting community . This whole kite festival weekend is subsidized by them . They provide the location for two evening meals , door prizes, competition prizes and the list goes on . We thank them for that.</p> <p>Spectre , did you fly your new 12 pointer this weekend???</p> <p>Let us know.</p> <p>CLIFF</p>

Hi, smarties

There is an information about the plan of the kite. In the link below, bjorn says that there is a plan of it on "drachen magazine" on mid of 90s. May be he can help us about finding the designer.

<b>CJQ</b> Grand Champion, Kitebuilder of the Year 2006  ★★★★★  Joined: 27 Dec 2003 Posts: 1702 Location: Coopersburg, PA - USA	<div> <input type="checkbox"/> Posted: Mon Sep 27, 2004 11:00 pm    Post subject: D.S. Weight Reduction <div>QUOTE</div> </div> <p>Hi Bernie , Thanks for compliment, it was the kite.</p> <p>The star flew very well on the first day we were there. the winds that day were prox 15 mph. and steady. The spars I used are 2800's. sixty inches long. In order to use them and because I needed 63 inches for my star I had to extend them by 3 inches. I cut 4 inch peices of 10 mm spars and glued them 1 inch on to the 2800's. thus giving me the length I needed. The other end got a 1 inch sleve of 10 mm to increase the 2800 dia to match my fittings. Doing so also allowed me to re -use my hub. The hub as I previously mentioned was reduced in diameter for additional weight loss. The following day the wind started out at around 4 to 5 mph. at about 5 to 6 mph the star would go up and maintain height if I walked back slowly . At around 6 to 7 mph the kite would stay up on its own. So the range for flight is prox 7 to over 15 mph. I am not worried about winds up in the upper teen's as you can adjust the attack angle to dump the higher force. The 2800's assume a slight bow when under sail tension. the flex is about 3/4 inches at the center. that did not appear to change at higher winds. I feel confident in the spar size selection. At first my thought was I now have a set of low wild spars and a set of wigh wind . Now after testing, the 10 mm spars will be used on a future kite of some sort. Or maybe on a 12 pointer???? dont know yet.</p> <p>Hope this helps you star builders.</p> <p>CLIFF</p>

Hi, spectre and thanks for your doublestar plan and all the great pictures!

Yes, there is a plan for a similar kite (8 point, 2 m diam.) in Drachen Magazin, Issue 8 of 1998. There it's called Starflake. The author of that plan is Dr Bernard Malle from Germany. However, I don't think he is the designer/inventor. He writes in the article that he had seen it on a video from a Fanoe Kite Meeting and wanted to make one himself. (Just like you, spectre 😊)

More infos on Drachen Magazine kite plans (in German): [http://www.kai-splett.de/dra11\\_1.htm](http://www.kai-splett.de/dra11_1.htm)

I am planning to make an 8 point, 2m Doublestar myself (using your plan) as a winter project. The winters are loooong here in Scandinavia... 😞

/bjorn

Hi, Kitesquid thanks for your words. But before I said, I not the designer of the kite.

I saw this kite first in year 2000 and than 2002 in the air. And I build my own plans at home. Probaby the panels are different from the other ones which I saw.

I stand corrected, but thanks for your AutoCAD skills!!!!!!!

I got a little sewing done. But then it was a choice between sitting in the basement sewing or throwing a steak on the grill for dinner and sitting down to a good action film with a beer 😊😄 So a couple of hours later when I finally got back to sewing, I did make some progress. I must say that seeing the kite grow is much more fun than watching the pile of hemmed pieces grow 😊 Sunday was spent working an early overtime shift and driving 300 miles round trip to retrieve my son from grandma, but I did manage to get all of the A, B and C pieces for the top done. I'll start on the bottom tomorrow. I'm waiting on the D pieces until I figure out exactly how I want to do the tips. I'll post progress photos tomorrow.  I am getting excited to see the kite done 😊</p> <div> <div>PROFILE</div> <div>PM ME!</div> <div>E-MAIL</div> </div>

I have the fittings. Just trying to decide how to get from the tips, to a string, to a fitting 😊 Right now I am thinking about insignia cloth, ( color matching,) on the D tips. Grossgrain <a href="#">Webbing</a>, ( color matching tips,) going through plastic rings, ( like those used in the Gary's square star,) to adjacent tips. Dacron line, with knotless knot, around plastic ring going through fitting at end of spar.  This way I will have one line from the bottom and one from the top going through each of the ten spar tip fittings. This will give me the ability to adjust each of the twenty tips seperatley. Once they are adjusted, I should be able to slip the fitting off of the spars when I take the kite appart, ( ready to go for the next time.) 😊  Anyone see any problems with this plan 😊</p> <div> <div>PROFILE</div> <div>PM ME!</div> <div>E-MAIL</div> </div>

[QUOTE](#)

Hi, Yesterday I went to fly my 12 point DS again. First I went the area there is no wind but after I finish the building kite the wind comes. It was 7-8 mph. The kite flies well but there is a problem with my spars. The spars which I connect bridle bends too much. The 10 mm spars are thin for 3.4meter kite. Probably I'll insert 8 mm **Carbon** inside these spars. May be this solves my problem or I'll use 12 mm on these spars.

But don't forget that the Avia 10mm spars are different from my spars. Avia's are thicker than my spars. Avias are 68gr per meter, mine's are 43 gr.

Here is the panel dimensions, A0 pdf plot files and Autocad files for mm and inch. These is dimensions for a 3meter kite. I made 3.4meter one.

[QUOTE](#)

Hi Grant , looks like your learning your A B C'S real well. Reminds me when I was building. Take notice how nice and flat the sail lays . Guess what , when you finish the final sew and the sail becomes round it dont lay flat any more . that drives me crazy. I have this thing about wrinkles - Ihate them . No mater how you will roll it up it will get big wrinkles , ya well!! Kite looks good Bud keep up the progress. Oh BTW tell us what method you select for the tip fastening.

CLIFF

I wasn't happy with my first attempt at sewing the "A" pieces together, so I ended up starting again and using the bottom A pieces to make the top, ( I got my technique figured out and all went smooth the second time around.) I went back to cut out the extra pieces to make the bottom A section, This is how much I had left when I was done 🤔 **ALWAYS BUY EXTRA.** I really lucked out this time 😊😊

<b>rbojarski</b> Master Kite Builder  Joined: 30 Sep 2003 Posts: 440 Location: Auburn, Washington	<div> <input type="checkbox"/> Posted: Fri Oct 08, 2004 1:27 am    Post subject: <div>QUOTE</div> </div> <p>I finally got all the sewing done on my double star. The colors from the center out are white, raspberry, yellow, and purple. I'm going to use the MAKR fittings Steve sells for tensioning out the sail. I put loops (or tabs) on the ends of all the parts D, then attached 18 inch long lines to each of the tabs, then threaded the line thru opposite ends of the MAKR fitting. The intent (with Cliff's suggestions) is to leave the fittings unattached to the radial spars. During assembly, I can slip the fittings over the spar and tighten up the strings to tension out the sails. Sorry, I didn't take any pictures. I then tried to assemble the kite. Got to about the 4th spar and discovered I got something horribly twisted on one of the boxes while attaching the lines to the MAKR fittings. I had to detach half the lines from the fittings and untwist the kite. I decided to quit at this point and try the assembly again tomorrow.</p> <p>The kite pretty much takes over whatever space you use to try to assemble the beast. Not quite sure my living room is large enough (10+ foot diameter circle) to assemble the DS. I think it may just barely fit, with no room left over.</p> <p>Haven't even thought about trying to make a storage bag for this, yet. Cliff and Bernie....what did you end up doing for a storage bag?</p> <p>Ray Bojarski</p>

I was planning to leave the 'boxes' attached to the center spar, and then just wrap the kite up around the center spar. I just straightened out (I hope) the lines thru the MAKR fittings and rolled up the kite around the center spine. The last couple of wraps just aren't all that neat with everything wrapping around each other. I haven't tried to assemble it again. Maybe later on today. I have to head out later to get some 1.5 ounce material to make the bag for the DStar.</p> <p>Ray Bojarski</p>

EDIT

I got this comment from a mechanical engineer friend about Delrin. I though it might be useful to know this:

"Delrin is a good material, and is very easy to machine. The problem is, it absorbes humidity easier than metals, so it will change in dimensions when in the presence of humidity, and it doesn't need much. At Comdev, the guys use to joke about it changing dimensions while you were holing it in the palm of your hand. Another caractiristic of delrin is, if you burn it, it sends off toxic fumes. Trust me, I know that one for a fact. Rick Saulnier does too.

So if you use it in an environment were tolerances are loose, and no chance of fire, it would be OK. Practically every machine house in town knows of delrin, and carries it."

Smarties 😊

While I was in the Navy the first firecontrol system I worked on used Teflon insulation on its miles of wireing...

When Teflon burns it gives of Diphosgene (SP?) gas. A nerve agent....

So we would have to solder carefully.

My first experance with Derlin was back when I raced RC cars and I would replace every alumnninum part with a Derlin part to save weight, Especially unsprung mass.....

Just to confirm Ray... those fittings are called MKS Fittings. You got the wrong kitebuilding retreat! MKS = Maryland Kite Society.

Find them [HERE](#) Click on the photo for more information.

QUOTE

I put the double star together yesteday at the local kite shop. The kite took up most of his shop. The MKS fittings seem like they will work, but I did have some problems trying to get equal tension on all of the 10 rods. I now have a question about how to attach the bridle lines to the kite. The [Bridle Line](#) from the center hub will not be a problem. I have a tension line pulling the boxes into the center of the kite, so I can just attach the center line to the grosgrain loop attaching the front box to the central spar. Any ideas how to attach the bottom two bridle lines to the lower spars the will allow the bridles to remain in a fixed location, and not either slide up the spar to the center of the kite, nor pull the MKS fitting off the spar?

I forgot to bring along a camera, so I have no pictures of the kite. The owner of the kite shop was impressed with the kite, and is seriously thinking about building one.

Thanks,  
Ray Bojarski

QUOTE

Hi Ray , happy for you, glad it's done. The two bridle attachment points can be a simple larkshead loop an the two tips just inside the end caps. Take a soft vinyl end cap and slice off some peices and slide two onto each spar just inside of the adjustable cap . seperate them an 1/8th of an inch ,then put a dab of glue on each to prevent them from sliding.Take a loop of line and larkshead onto the spar letting a pigtail about two inches long. That can remain on the spar when stored. Your bridle then will have a loop so you can larkshead to the spar loop. Now you dont have to distrub the adjustment at breakdown time.

Dont forget pictures!!!

Mine is going to take a little longer. I got the smart idea of offering to make the kids mummy costumes for Halloween. 😊 ( Much more time consuming than you would think.) I have gone through more bobbins of thread sewing my son's, than I used sewing all of the DS so far. And I still have my daughter's to sew. Not complaining because I love making stuff with/for the kids, but I'm getting anxious to see **MY** kite all assembled. 😊

Halloween costumes done. Back to sewing kites 😊 I'm adding reinforcement to the D piece tips. The D pieces come to such a sharp point when you fold the hem, so I cut the end 2" off, ( this leaves the width of the tip the same as the width of the grossgrain ribbon that will get sewn on.) I applied insignia cloth to white dacron reinforcement pieces and cut them into a shape that match the shape of the tips and are 3" long. These pieces then get sewn to the tips. The ends in sight. Getting excited 😊

Hi, Grant

Very nice detail and very good sewing. Better then mine.

I am taking questions about sewing the center of the kite. I made a drawing.

Co you think that this helpfull or not? Do you have any suggestions?

QUOTE

Hi Ferruh, Looked at the line dwg. above, the one on the right helps a lot. I think the line dwg. that you posted long time ago along with the picture on the right together make it much easier to understand the sewing proceedure. ( the picture that has printed Panel A X 10 showing a line dwg. of an end view of the sews.)I went back to very early posts and saw you show the other stars people have made from your plan , It must make you proud !!

<b>Grant L</b> Kite of the Year 2004  Joined: 16 Sep 2003 Posts: 1507 Location: USA IN Indianapolis	<div> <input type="button" value="QUOTE"/> </div> <p>Posted: Thu Oct 28, 2004 7:33 pm    Post subject:</p> <hr/> <p>Hi Ferruh,</p> <p>The diagram does help show how to sew them together. I used something similar. On my cutting mat, ( it has grid lines which help,) I line up the left edge, ( under point 1 in your diagram,) with one of the grid lines. I put a piece of tape, perpindicular to this grid line at the tip of point 1. I then line up another piece of tape, parallel to the grid line, and a distance equal to the three hem allowances, ( 8mm + 5mm + 8mm .) away, (going down from point 2 in your diagram.</p> <p>Line up the first piece with the grid line. Place the second piece, ( good to good,) on top of the first piece, lining up the edge with the tape( I could just make out the tape edge through the <a href="#">Ripstop</a> to line up the second edge.) I lined up point 2 with the perpindicular tape, ( so it will be the same height as point 1,) and using double sided tape, stick them together. Every now and then as you are sewing, lay them out and see how consistant you are. You might have to make minor adjustments. When I finished mine, it wasn't perfectly lined up, but good enough that when I sewed the first to the tenth, it all worked out.</p> <p>Thanks again for providing all of the plans and info. Steady Winds, Grant L</p>

[QUOTE](#)

Thanks Cliff and Terry,

The blue is Challenge dark blue seconds. I had to move a table and a chair out of the way to have enough room to spread out the kite. I knew it would be big, but it takes spreading it out to see how big it really is. I am really excited to finish it.

I would love to go to the nationals, but it will always be during the school year. Our schools really penalize the students for absence, ( its all about funding 😞 ) I got to go to Dayton last year because it was within driving distance. I am planning on taking the whole family to Dieppe next summer though 😊 I asked and the kids agreed to be my ground crew for the DS mass launches 😊 😊

I guess I'm comin in a bit late. But I'm planning on making one of these DS's mentioned here so many times over. . . 😊 I don't think I'll have it finished really soon unless the winter months get me more motivated to sit in front of the machine. I have quite a few colors to choose from spectre you mind sending me the autocad drawing so I can play around with colors? Email it to [lowerdfool@yahoo.com](mailto:lowerdfool@yahoo.com)

Congratulations Grant - looks great! Cant wait to see it in the air....

Do you like the way the MKS Fitting worked? Can you get the tension real tight without slippage?

Steve,  
I like the fittings. I found out that you need at least 75# test. I tried 50# at first and it would slip under tension. I will be adjusting and flying this weekend so I will get a better feel of how they will work out. If I need to, I can always go to 100# line. Can't wait to see it in the air. 😊

we are all waiting to see it in the air ! 😊 warning! make sure you have good anchor if the wind is strong ! seen some day were I needed to anchor to my truck !! but the feeling ....and the rush you will get went it goes up ....man what a super flyer ! I know you will enjoy! Cliff and all the others can vouch for that statement ! hope for good winds ! 😊

Good - let me know. I would think that after you have it all tensioned up - EQUALLY around the whole perimeter, you might want to put a mark on each line at the screw point. When I first discussed this fitting with Cliff I was worried that it would be too easy to tension it up UN-equally. So... square it up then add a reference mark - it will make it easier the next time...

I was browsing through a fighter kite web site to see some of the action at AKA Nats. and came across this photo. You will find things in the strangest places!!!

You may recognize one of these kites.

You can see a MUCH larger picture at this link:

( I didn't notice till I was setting it up, but it was too hard to change in the field. Plus the sun was going down fast 😊 )Thanks to Smarties for getting all this started and to Bernie and Cliff for leading the way and answering all of the questions. Also to Steve and Tony. The parts and fitting really worked great. ( I switched to 160# line for the MKS fitting and they seem to be holding fine under all the tension.) And to Spectre for the great detailed plans and assistance. I can't wait til Dieppe 😊😊</p> <p>The photo is a bit dark but the sun was pretty low in the sky. You can tell from the attached turf that the feild was a bit soft from the recent rain. In fact, the sun just ducked below the horizon as the kite touched down. What a way to end a really rewarding and fun project. 😊😊😊😊😊</p>

## Congratulation!

What a super nice kite ! I'm sure you now know what we said about the feeling you get when it goes up ! What a nice way to paint the sky ! Looking foward to seeing it here in Dieppe for the 2005 festival ! Now I hope all of you that have build and those that will build the DS will start thinking of Lights in the DS for our Nite fly ! Wow ! That will be a show !

once again GrantL you did a super job with the colours ! Something to be proud of ! 😊

[QUOTE](#)

Hi Steve, Shame on me, I was just gem scanning some various threads and came across the one you posted asking about the sparing in the photo above. Yes , the spars you see are the light weight ones . They are the 2800's 5 ft. one peice. the wind is about , as I recall 7-8 mph here in Seaside at the time. The spars as you will note all have a slight bow , all in the same direction. Thats a good thing for two reasons. First they will flex a little more when subjected to higher wind load and also allow the tension to "even out" keeping all tip sails tight. The 10MM spars I originally used certinly are good for high winds ,the star pulls like a bear in high winds and anchoring is advisable. May re use the 10's for a bigger one?????

Well I thought I would revive this popular thread with an update of my own...

After a 1 month hiatus due to work (I can't beleive how much work interferes with valuable kite building time, geeesshhh 😊) I got back to working on my double star...

Here is where I am with the top... Just added the "C" panels tonight.. tomorrow will be the "D" panels. Then I will start on the bottom.

The colors are Silver, violet, raspberry and black in case you were wondering.

More photos can be seen here..

<http://www.steadywinds.com/gal/dstarbuild>

	Cheers, Bill  --Bill

Bridling <div>QUOTE</div> </div> <p>Hi Grant , I think by your description the Star was flying just above the minimum wind speed. Tension on the center bridle attached to the point with slack in the 2 lower bridle lines indicates the wind pressure is just great enough to create lift . As the wind speed increases the lower bridles will go under tension. If you fly in extreme winds the attack angle will be close to plumb and all bridle lines will be taught, also the Star will be almost straight up. This is a must wear gloves , hold on tight situation. Wow I get excited every time I think about flying the Star.</p> <p>CLIFF</p> <div> <div>PROFILE</div> <div>PM ME!</div> <div>E-MAIL</div> </div>

I think that there was plenty of wind, ( at least 13 knots.) I may have had the vbridle point too high. When it was flying, the sail surface was almost straight on into the wind and the kite wasn't pulling too hard. I did lower the bridle point for a while and the kite pulled harder and was flying almost overhead. The field was pretty muddy, ( I was hoping to fly the gecko finally but decided to wait 😞 ) I'll have to go out again when the field is dry so that I can walk the kite down and play with the bridle point some more. What are the lengths for your bridle lines and the general point where you attach your flying line, ( You too Mountain Man.) I'll have to measure mine and compare to what you two are flying with 😊</p> <p>I also want to take the time to measure the distance between the sail tips and the end of the spars so that I can mark all of the lines at an average distance and even out the sails 😊</p> <div> <div>PROFILE</div> <div>PM ME!</div> <div>E-MAIL</div> </div>

Back out of retirement filling in for one of my son's employee's. That's the bad news the good news is that I'm shaking the money tree. Gettin some bucks for my AKA trip in Oct.</p> <p>About the panel " D" tips. ,As Bernie has mentioned he used velcro pockets to tension the sails. I used gross grain loops on the tips and <a href="http://www.kitebuilder.com/catalog/index.php?cPath=29">http://www.kitebuilder.com/catalog/index.php?cPath=29</a> End Caps I made with slots for adjustments. However , since Bernie's and my kites were made some further thought has been given and a special end cap was suggested for that application. The adjustable end cap is in the kite studio catalog and it's called the MKS endcap. It has a hole drilled thru the cap 90 deg. to the center line and a nylon set screw to affix a line that is passed thru the side hole . The recommendation is for a 200 lb piece of line be sewn to the panel tip . that line is then slipped thru the fitting and locked in place by the screw. VERY SLICK APPLICATION. I said it was a special end cap ,not really , steve can make them up easily. I believe that Ray B. , Grant L, and Canadian Bill are employing this method. Probably if Bernie and I knew of the fitting that's what we may have used . The fitting can be left in position at dis - assembly , plus it allows tensioning of the front and rear sail individually. NEAT&gt;</p> <p>Hope this helps you marc.</p> <p>CLIFF</p> </div> <p>Back in September Cliff posted this information...</p> <p>I have a question.. I plan on shortening the tips and adding dacron like Grant did with his kite. Should the line be sewn into the hem? if so which side of the hem, top or bottom? I was thinking I could sew a single length of line in both hems forming a loop at the tip and then tie off a piece of line to this loop to travel through the MKS fitting. Maybe I should use gross grain or flat braid for those sections...</p> <p>Any advice?</p> <p>--Bill</p>

<b>CJQ</b> Grand Champion, Kitebuilder of the Year 2006  Joined: 27 Dec 2003 Posts: 1702 Location: Coopersburg, PA - USA	<div> <input type="checkbox"/> Posted: Wed Feb 16, 2005 10:08 pm    Post subject: Tip's on D panel. </div> <div> <a href="#">QUOTE</a> </div> <hr/> <p>Hi Bill , I understand the method you have in mind . I think it's fine. Make sure that the center of the loop that is formed completes a natural triangle. What I mean is if you draw an imaginary line along the D panel edges the lines will intersect at the point your second tensioning line will attach. If that does not occur the panel tip will de-form and not be flat. Sewing in a loop will not creat a future problem as there is no reason for wear-out since it will be stationary. 200 lb. line or such will work , it wont see that stress but will sew easier and wear longer. Hope this helps. Any other thought's out there?</p> <p>CLIFF</p>

<p><b>wdrwilson</b></p>  <p>Joined: 24 Oct 2003 Posts: 1359 Location: Canada, Nova Scotia, Halifax</p>	<p><input type="checkbox"/> Posted: Sun Feb 20, 2005 10:51 pm    Post subject: <span style="float: right;"><a href="#">QUOTE</a></span></p> <hr/> <p>I have now attached the "D" Panels to the first half of the Double Star. I reinforced the tips with 3" of Dacron and then used gross-grain tabs for the tension line attachment points.</p> <p>Being the impatient type, I decided I had to see how the star looks when assembled. So I managed to attach 6 spars to the hub and then I ran out of room (as expected 😊). Here is what it looks like...</p>

Now onto the bottom... in retrospect I should have built each half together instead of completing one and then the other. ahh well, I hope to have it done in the next 10 days or so. More photos here!

<b>Grant L</b> Kite of the Year 2004  Joined: 16 Sep 2003 Posts: 1507 Location: USA IN Indianapolis	<input type="checkbox"/> Posted: Mon Feb 21, 2005 9:56 am    Post subject: <a href="#">QUOTE</a> <hr/> Looking Good Bill. 😊😊😊 Keep plugging away. The end is in sight. One thing I foud, with the MKS fittings, I had to go to a pretty thick line, ( I think at least 120# test, maybe more. I'll take a look when I get home today,) to get them to hold once you get the kite all assembled. The sails are pretty taught once that last spar gets put in place. Can't wait to see it in the air. I am curious, how many DSs will there be in Dieppe this summer ? I can't wait to see them all in the mass launch! 🤔

I only edge bound 20 panels but it took a lil over an hours time. If I can do that 4 more days in a row I'll have all the edge binding done. Then it won't be long before it's complete. <hr/> Here's my thoughts on my D panels and the tension adjusting. I went with the same idea that cliff came up with to use the mks fittings from steve and a peice of dacron line sewn to the end of the panel to help set tension adjustment. But I think I'm going to go one step further and sew on each panel 1 peices of dacron line to one edge and another to the other edge then sew the two pieces together to make them one solid piece. It would look something like this: >=== It would be really nice to be able to sew the dacron in while sewing the edge binding, that way it puts tension on the seams along the edges of the panel to keep it nice and taught. How tough is it to sew 2 peices of 150lbs dacron to each other? I'm not wanting another timing malfunction on my machine because the dacron line got sucked in through the needle plate. <hr/> Chris Taylor Dayton, OH

Have you tried to fit 8 lines through the eye of an MKS fitting... A much</p>

thinner line than 150lb will probably have to be used. The thinner line will be much more challenging to sew together.

I originally started with 250lb and I couldn't fit two pieces through the eye, now I am using about 100 lb and I think it will be a little tight. 😊

[QUOTE](#)

Finally the Double Star is complete. 😊 I finished off the last of the bottom section late this evening. This kite is really impressive when it's fully assembled, a full 10 foot diameter! (old news for most of you 😊). I haven't adjusted the tip tension much but it seems that the MKS fittings will work out fine.

Here are the first pictures of the kite completely assembled. I have to add the bridle and it will be ready to fly! 😊

More photos <http://www.steadywinds.com/gal/dstarbuild>

cheers,  
--Bill

That didn't stop us though. I hadn't bridled the kite yet so I did that in the field as well, very cold fingers after that 😊.</p> <p>It was a little too cold to adjust all of the tips so I decided to give it a go anyway.. and it Flew... It launched with the roar of a jet plane and was stapled to the sky. When the wind would shift it would sweep a little but nothing a little slack in the line didn't fix. Very happy!!!!</p> <p>What a great feeling...</p> <p>The wind was really blowing hard and I had visions of the 10 mm Carbon rods snapping like twigs...Lot's of pull on this kite. So I handed the kite off to my friend, and walked the kite down.</p> <p>Here are is a photo, the sky is grey today but I brightened the photo up the best I could..</p>

click on the photo to get the full 800 x 600 image.

Cheers,  
Bill

super nice bill ..... like I said many time ....flying that double star for the first time is quite a thrill ! 😊 even now when I fly mine ....its still a thrill ! and yes sounds like a jet ! j

Hope we can fly the two ds on sunday ! would love pics of that for sure ..... 😊

Bill,

the new DS looks great! I have to admit, I wasn't sure about the color choices when looking at the inside pictures, but it looks great outside! Yours and MM's really compliment each other too.

[QUOTE](#)

I FINISHED MINE THIS WEEKEND!!! 😄😄😄 Flew it yesterday for a local fun fly where news groups were taking photos and videos. It may be in a local paper. The girl with the camera took about 3 dozen photos of it. She walked over right after my girlfriend and I started assembling the first few spars and just kept clicking away. She mentioned out of all the kites she had seen this one was her favorite. There was even some large peter lynn inflatables flying that caught a lot of attention.

I still need to get my tensioning set right the sail seems a little loose in the front from the bridle pulling. When I first put the spars in they bowed all the way to the bottom side of the kite. So I needed to cut them down. I measured the dimensions across the points and ended up cutting each spart 1.25". I'm wondering if I shouldn't have left that .25" extra. I have about 1.5" of tensioning line for each point, which I'd like to keep around as the sail stretches over time.

I'm very satisfied with the results so far. It'll be even better when I get that sail tensioned where I like it. We got rave reviews from all of the people from pigs aloft. Can't wait to get some up to date photos on here of the finished kite in flight. If I can get in contact with the photographer from the paper that'll be even better since I didn't get any yesterday with my own camera. I don't know if I got cold chills from the 30 degree weather or the joy of seeing something I've put many hours into fly for the first time. It became "weightless" in a matter of seconds when the wind filled it's sail. Beautiful.....

Thank you for inspiration and knowledge kitebuilder and folks. 😎

😏 Shame on you Fool for not getting pictures. I can understand how you would be distracted though ( Thinking to yourself: Wow, I built that 🤖 😡 )

Congratulations on finishing it though. Maybe we can have a mini-DS mass launch on April 10th 😊 Looking forward to meeting you and seeing the DS 😄

My own digital camera was on my kap rig which I still have yet to get into the air. Just not enough steady winds around these parts for the kites I own to lift it. 😞 I'm going to HAVE to make something soon. DOPERO 💡

Wasent it exciting ? flying right out of the box and being such a crowd pleaser. I get all cranked up listening to D.S. stories. Makes me want to run into the kite room and take mine out and hug it. ( guess I got to seek counceling) The 1 1/2 in of tensioning line is quite ample. My Star has not streached much at all. Humid days make very little difference. I read that your spars have a bow? is that correct?? If so what direction do they bend. I use as my light wind spars 2810's. The spars all get a bow when the assembly is finished. Probably a 2 in. bow in the center. It suprizes me the 10 mm spar bows. Thats a hefty spar. Now that you have joined our group you must go to the DIEPPE Festival,,,What do you think Bernie???Any way , looking forward to the pictures. Another thought just crossed my mind. When down in florida last few weeks I flew my D.S. . The friends I was staying with live in a Golf community. I decided to fly my kite in a grass area aside one of the fairways. The D.S. wasent up more than 5 minutes and there were at least 15 to 20 people standing around (two with cameras) watching the kite . All were totally amazed. There is something about this kite that grabs peoples liking. Of all the kites in my collection this one by far is the most attention getter. Happy flying!!</p> <p>CLIFF</p>

CLIFF

The spars used to have a bow before I cut them down 1.25" each. So now I have (10) 58.75" spars. They would bow from the points to the back side of one of the halves. Way more than I liked hense the reasoning behind cutting the spars down. I just need about an hour and 4 extra hands to tension the kite properly then it should be set for life.

I have the center hub set up to free float on the center spar. The way the first 4 broke were a freak accident for the most part but I think my bridle points are wearing on the spar ends so I'm going to put a solid piece of <b>Carbon</b> in each end of every spar about 5" deep. The wind I was trying to fly in was between 13-17 with gusts of 23 on occasion and I was holding the bridle point when I heard the spar split. I'm planning an making the hub stationary to help keep the spars straight and make them a little more rigid overall instead of allowing them to flex. What are some ideas for keeping the hub centered, but also being able to remove it for packing the kite? I was thinking some o-rings or small rubber bands between the feral and spar would prevent the hub from slipping. I'd really rather stay away from permanently gluing the hub to the center spar.</p> <hr/> <p>Chris Taylor  Dayton, OH</p>

I have yet to break a spar ! my line are also sort of free on the spars ! but I use the 10 mm spars! what size are you using? I have put lots of milage ( hours of flight) on that kite and flown in winds that gusting enough that I had to anchor to my truck as I could not hold it any more (old man) .... but maybe just luck but no broken spars ! but I would be afraid of making the bub solid I know some have done that but I surely would not ! 😊</div> <div>Bernie the Mountain Man Paint the sky... I have not had a problem with the 10mm , my hub is fixed . There are two theorys about fix or float, both make sense. I have had some bad crashes with no problems. The damage I do get when flying on sand is when the star comes down hard ,the back nose gets buried in the sand. It started to do a number on my sail point. My next star will have a large diameter cone shaped disc fitting to prevent that from occuring. My light wind spars are 2850's ,5 ft long. I re-used my origional hub drilled for the 10mm's. To adapt them I cut short pc's. of the 10mm and glued the (externally) adaptors onto the 2850's. I actually needed slightly more than 60" so the short adaptors act like external <a href="#">Ferrels</a>. Not good,,, The 10 mm pc's are straight grain <a href="#">Carbon</a>, not a good external ferrule, they split when stressed. To solve that problem I installed 3/8 in. brass sleeves (collars) on the outer tips to prevent splitting.The 2850's reduced my spar weight by 50%. I plan on re-using the 10mm's on my 5 meter 12 point star now under construction. Havent decided on what extension material I will use for the additional lenght required,or what kind of ferruling. Let us know how you make out with your changes.</p> <p>CLIFF</p> <div> <a href="#">PROFILE</a> <a href="#">PM ME!</a>  <a href="#">E-MAIL</a> </div>

I'm told one was still on the ground. Ausum photo , wish I was there. Glad you are going to do the star. As for the shock cord I would rather go with a thick dacron line (hollow core) rather than a heavy duty bungie. Some guys used velcro pockets , others used a heavy line sewn in to the tips. The ones using line fastening are tensioning with the MKS fitting Stevef sells. I , for a few reasons would choose the MKS fitting with a nylon set screw, simple and effective. You will find that as careful as as you sew some panels will end up a little floppy in the wind. The shock cord method may not provide enough tension to sinch up enough slack. IMHO, Dig your heels in and give it a go , be shure to show us your progress.</div> <div>CLIFF</div>

[QUOTE](#)[EDIT](#)

Nice work. I like the idea of a spider. 🤖

I can't believe this thread is still going on. The double star is surely a big hit and well deserves the 2004 kite of the year title. 🤔

Smarties 😊

[QUOTE](#)Hey guys, I have a silly question. When you use the tinkertoy hub made by Steve, how far are the inner ends of the rods from each other? In other words, if I stick two 48 inch rods into opposing holes, are the outer ends  $(48+1) \times 2 = 98$  inches apart, or is it some other measurment? ? ?

"The wind is the perfect reminder of God.

The only way we can prove it exists is by observing the things it affects.

That's why I believe in the wind, too."

<b>CJQ</b> Grand Champion, Kitebuilder of the Year 2006  Joined: 27 Dec 2003 Posts: 1702 Location: Coopersburg, PA - USA	<div> <input type="checkbox"/> Posted: Fri Jun 10, 2005 9:23 am Post subject: HUB HOLES <div>QUOTE</div> </div> <p>Hi Dorsal, good question. I dont think there is a fixed dimension. The depth of the holes in any given hub will be determined by the type of spar material and the diameter. or, wether the hub will have a center hole ,or the number of spars that will be incerted in that hub.The hub would be made to the smallest size possible to reduce weight. The other factor is to provide the optimum engagement to reduce deformation under load. The number of spars must be taken into consideration cause if the holes are too deep they will interfere with each other in the center. So, I geuss there is not a standard. Tony , when he designs a hub must know what the application is before he starts.Refering to the hub I made for my D.S. started out at 5 in. in diameter. there are 10 radial spar holes and one in the center for the spine. Spar size was 10 MM. the original radial hole depth was1 3/4 in. The holes were aloust touching at the bottom of the drilling. Thru trial and error after the star was flown I went thru a weight reduction process. The hub diameter was reduced from 5 to 4 in's. that reduced the hole depth by 1/2 in. leaving 1 1/4 depth. That dimension is quite sufficent to provide adaquite strength. The hub thickness is 3/4 in. Doing the math as you had mentioned earlier adds about 1 1/2 in's. to the total(opposing)spars. This is MHO. Steve or tony may add or correct this info. Dorsal you going to make a D.S. ???</p> <p>CLIFF</p>

---

Ferruh - I was planning to use 60" (150 cm) rods, which does come to 3m, now that I think about it. Thanks for the panel layouts - I'll check the dimensions against the ones I came up with. Do you maybe have an image of the completed kite, that I can see the proportions of the panel layouts?? If so, would you please let me know, or email them to me?

☺ ☺

[QUOTE](#)

**jason g wrote:**

Like I told Cliff a couple of weeks ago, I feel like I'm standing on the shoulders of giants in just attempting a doublestar. This first one of mine is just an 8 pointer. Instead of the circular patterns I tried for a spider look with the black legs and red body on (everything else) white.

How successful will depend on how it looks in the air, but of course no co-operation in the wind dept today. As usual I really learned a lot in making this kite.

Very good Jason! Tying the graphic into the shape of the kite.... bonus points! You have come a long way...

You guys interested in kitemakers competiton... watch out for Jason!

Super job,

Steve Ferrel

[QUOTE](#)

**Dorsal wrote:**

Hey guys, I have a silly question. When you use the tinkertoy hub made by Steve, how far are the inner ends of the rods from each other? In other words, if I stick two 48 inch rods into opposing holes, are the outer ends  $(48+1) \times 2 = 98$  inches apart, or is it some other measurment?

Denis, how far apart would you like them to be? I am at home right now and dont have the fitting in front of me, but we can make them to your spec... as long as the holes do not intersect. Realize when you drop a drill 2 inches into plastic, you do not get a 2 inch spar insertion.... drill bits are pointed...

[QUOTE](#)

Well Steve - I did my design as if the spars were  $60 \frac{3}{4}$  inches long, 8mm in diameter. So, I presumed the bottom of the holes described a circle  $\frac{3}{4}$ " in radius, which leaves about .435" (less the drill point) of "stopper" at the bottom of each hole. If the hub were  $4 \frac{1}{2}$ " in diameter, that would allow the rods to insert about  $1 \frac{1}{2}$ " into the hub.

That should work, right? I'd like to reduce the diameter from 5", to reduce the weight as much as practical.

Hey, a question for the group: I am thinking about "gilding" the edges of the panels. Does anyone know of a source for GOLD ribbon, say,  $\frac{3}{4}$  - 1" wide, that would work? I was thinking to stomp around the local JoAnn's to see if they have some decorative ribbon that might survive being sewed to a kite. Any other suggestions??

P

Yes Sir... I was taking photos of Meg Albers helping Pierre Fabre get his Space man in the air and didn't even notice it until I reviewed the pictures later. I thought it looked cool so I included it in the gallery 😊

Cheers,  
Bill

Once we finish building a few I'll post up details for anyone interested. Hopefully it'll be able to fly indoors or outdoors in decent breezes. I'll let you all know more info later though. I will say it won't take but a day or two to build. I've got plan drawings on my pc but need to make sure everything goes together good before I expose them.</p> <hr/> <p>Chris Taylor            Dayton, OH            lowerdfool(at)yahoo(dot)com</p>

A question for all you double star experts....

I do promise to get mine in the air one of these days 😊 , but I've been thinking about the framing for the D-Star.

After building the G.Envall square flake, S.Spencers 5 sided facet kite, and a Pefado which is an 8 sided cell kite, I curious about the framing on the D-Star. Why can't the kite be tensioned with spars around the circumference of the kite kite the pefado and facet kites? This would eliminate the heavy center spar, and the 10 spars around the circumference of the star would be considerably shorter than the total length of the spars radiating out from the center of the kite.

It seems the star could be assembled/disassembled much quicker using only the circumference spars.

Has anyone else thought of this or tried this? How heavy would the circumference spars need to be?

Thanks,  
Ray Bojarski

I've been thinking about this since I'm planning on sparking the mini DS the same way. If it was jointed I don't think the spars would work but as one solid looking ring it might work. I'd imagine the outter frame would have to be fairly tough since the sail pulls inward as the winds get stronger. Although some good fiberglass sparing would be a lot more rigd overall. You'd shave the weight of 3 spars since it would only really requilre 6.5 to get a 10' diameter. 31.4159' to be exact. Hmmm. It might just work. Give it a try and tell us if it works.

For joints I would probably try to use reinforced plastic tubing, like Scott used on the facet kite, and like I used on the Pefado. The tubing has some amount of flex to it, and would be much less of a bend than the 5 sided facet or the 8 sided pefado. The pieces of tubing could be attached to the ends of the sails via split rings.

I was hoping someone like Spectre or Cliff Quinn could post a comment about perimeter framing. I really don't want to invest a bunch of money in 10 mm spars (or larger) is he has already tried perimeter framing, or can think of some reason why it would not work. I used .2500 fiber glass rods for the perimeter framing for the pefado. The kite ends up being about 60 inches in diameter. I'm using 8 pieces of rod, each 22 inches long.

It should work quite well on a smaller sized d-star.

On Pefado the spines are closer to the outside. Not in the center. So the Panels are very short and I think tension is less than on Doublestar.</p> <p>When I am flying my 3.6meter DS, I saw that there is too much stress on the lower bridle points. The frame bends too much. So I made a 4 point bridle. I connect an additional point to the back of the spine to adjust the angle of the kite. The bottom bridle points are to stop rotation of the kite. To reduce tension also you can use one point bridle. This is what I am doing in first flight. The kite pulls less and also tension is less. But the kite flows very low.</p> <p>There is a 2meter snowflake plan  <a href="http://www.geocities.com/p_lerich/snowflak/snowflak.html">http://www.geocities.com/p_lerich/snowflak/snowflak.html</a></p> <p>You can try a ring like here. It will be easier. Take five 2meter length 10mm FG. This will be more than you need but you can cut one of them.</p> <p>If I have time, I can try it easily but in these days I don't have time for kite flying. This year I can only join one kite Festival.</p> <hr/> <p>Best Winds,          Ferruh Baysu</p>

[QUOTE](#)

Hi Ferruh, as I mentioned before I am going thru a re-sparring of my new 5.3 meter DS The 10mm /8mm will not do the job. Ray did have a unique suggestion sparring around the O.D. The spars I initially used do ok for the kite once it's in the air. I expienced spar s braking on launch. To launch I pull on the center point and when the angle increases the star will lift off well. The problem is when it stands up all the weight ( 9.5lbs) is on the two bottom spars. The spars are 5 ft. 10mm ferruled with an 8mm to make up 8 1/2 feet. I wonder if an external sparring would function and spread the load. My plan is to replace the inner 10mm spars with 12.7mm and replace the 8mm spars with the 10mm. I did make a substitution of the 8mm on the bottom so the two lower ones are all 10mm. That stopped the brakeage. However I would like to add a safety factor with the new substitution. An additional benifit will be a little more sail tension with less spar bowing. The 12 mm star will launch at 5 mph wind. The top end is prox 10 to 12 mph. I had it up at 15 mph and had a scary flight. So , If winds are at that level It ain't giong up. Ferruh I bridle with 3 points ,two at the bottom and the center point. Do your DS bridle lines come to the fly line and meet at one tow point or do you spread the two from the bottom away from the center one.I do the latter. This seems to stop rotation somewhat.

Bjorn.....That's almost what I had in mind. I was thinking of using reinforced plastic tubing as connectors at the tips of each star point. The perimeter would then be a 10 sided polygon, not a continuous loop as in your pictures.

Great photos, of great looking kites.

I guess I'll just have to seriously thing about this mod.

Any idea what size rods I would need to frame the d-star with 10 perimeter segments? Would the 10 mm rods be big enough? Could I use something with a smaller diameter? Would I need something larger than 10 mm?

Thanks,  
Ray Bojarski

My thoughts on your 10 sided flexible jointed frame is that the frame willnot hold it's shape as a decagon. The tension on the kite will be of inward force and also front to back since the ds has in actuality 2 sails on one frame. The joints could possibly fold inwards with the flexibility of the star. If you look at a snowflake it is one point of fabric for one joint. The only way it would work on the double star is if there was EXACT tension on every point at the joints and then putting the thing together would make it even harder to assemble than the way it is done now. I think outside forces like a thump on the ground would cause the joints to change position as well. So even if it was exact tension all the way around it could fold up if the wind just suddenly dies off.

With a solid ring the tension doesn't have to be exact because the ring will more often than not hold it's shape bouncing on the ground or flying in the air.

The double star tends to fall like a rock in the sky if the wind isn't stable or consistent.

Bridle</p> <p>Hi Dave , just read your last post and my previous post asking Spectre about his method of bridling. Quite frankly I have egg on my face. The question I posed was Dumb. Dont know why I asked it. When I bridled my new 5.3 meter star initialy I hadto determine the attack angle. That was done by holding the blidles at the tow point ( 2 lower bbridles ,equal length) and the center bridle somewhat longer. By pulling the center bridle ,causing the star to stand up the star lifted by it self when the attack angle was almost correct. The part that I had failed to remember was once I determined the correct angle I brought the star down and added a secondary bridle to join the center and lower bridles. I added a double larkshead loop to that line so I could make slight angle adjustments when the wind force was higher or lower. As far as ROTATION I dont expirience that problem with my 3 meter star or the big one. When I see referal to rotation I think of spinning. Spinning never occurs. When the wind is shifty both stars will wander side to side. That is the nature of that kite. the benifit of adding more bridle lines spreads the load which is a benifit in high winds. Changing the subject,,,, I saw on a European link the double stars with an outer ring frame , also I saw in another photo the same star in a stack formation I think there was 4 or 5. Quite impressive.</p> <p>CLIFF</p>

I have two bags for each of my Double Stars. One for the sails and other for the spars. The hub gets placed in with the sail. You will notice that once a sail unit (front and back section) is completed the sail will no longer lay flat. When I break down my stars I remove all spars. I then will grasp the sail at the center end wave the sail in the air to get the panels as smooth as possible. But at the end your holding there will be a twist. I will try to carefully fold that twist as flat as possible.then finaly I will loosely fold the sail in prox. one foot sections starting from the center. You will then have 9 tips on the out side. That twist will be a concern each time you set your kite up. Best thing to do is fan out the sail ,step thru the cells to reach the center and shove the spine thru the center pocket and attach the sail. Next install your hub incert your spars attach the tips flip the kite over and repeat the process for the other side. I think each of the Star owners has his own method of assembly. I do believe we all have seperate bags. Hope this helps.</p> <p>CLIFF</p>

Posted: Tue Mar 14, 2006 11:45 pm    Post subject: Here's how I pack it.

[QUOTE](#)

Step 1: Grab and separate from the center points. You'll need to pull the bottom of the center out through one of the openings. So it looks like this. You'll also need to pull it tight for the next step.

Step 2: Fold the centers together. Make sure you keep the 2 halves separated.

Step 3: Gather the points into a bunch.

Step 4: Here you can add a rubber band or bungee to help keep the points from getting overly tangled.

I usually don't worry about it because it untangles in about 5 minutes anyhow. Just depends how "A. Retentive" you are.

Step 5: Have your "packing partner" pull the sail tight. No matter how you pack this thing you'll most likely get wrinkles.

It only needs about 15 minutes of sitting out and the wrinkles will disappear. Start rolling all the ends towards the center.

The tighter you get it the easier it is to pack into the bag. 😊

Step 6: Continue to roll it till you get to a nice roll. If the bridle is left hanging you can wrap that around to help hold it together.

Step 7: stuff it into it's bag. I put the hub at the bottom so I don't lose it.

When you go to unpack and fly seperate the centers undo your rubberband/bungie. Grab one point and another point a few points over and lift that over your head. This will find your center section of the two halves. Insert the center spar with hub and work your way around inserting the spars.

Wow Chris - Thanks for taking the time for the photos. The sail might get wrinkled, but I'm so simple that a few photos really explain a lot. 😊

Cliff - Next time yours are out, would you mind posting some "pack it up" photos also? I'm having a hard time visualizing what you describe. 😊

I didn't show the spar packing. It's basically just a 6'4" bag similar to that of a sport kite with a velcro close end. I leave the ferrule taped to the center spar so all I have to do is slide the up to the stopper fit over the other o-ring. and assemble.</p> <hr/> Chris Taylor Dayton, OH lowerdfool(at)yahoo(dot)com

Hello Ferruh, Thank you for sharing your photo's. For some reason I like your Double Star very much. The Panorama Picture is quite impressive. Gld you are still flying kites ,havent heard from you for some time. Dont be a stranger.

CLIFF

PS Had to come back and add this note Ferruh, The Double Star activity on this forum has had over 18 thousand 8 hundred views . By far the most viewed topic all because of your plans and Smarties recognizing a truly amazing kite. Thanks for making it happen.

Thanks Cliff for the comment. I haven't built one yet but it is in the queue.

Hi Ferruh, thanks for the picture and little story. Now that site is even more historical with you DS flying over. 😊

FERRUH, it's good to know you still have kites as a passion in your future. Now we have another challenge for you. Many are not as creative as you but have the ability to, build kites that others have created, such as the double star. If you develop a design and wish to share it with us we all would be appriciative.

Regards

CLIFF

Hi Ferruh, YES indeed the picture is very impressive. It is a dangerous thing to show me those DS/3DS images. I have too many things on my plate right now and this makes me crazy. I have downloaded the pic's. and will put them on my hot sheet to consider.

Regards

CLIFF

Just spar it in Stainless Steel Rods and you would never break one, the kite would probably never get airborne, in less than a catagory 5 huricane force winds..... but you would stop paying for Steve's next vacation..... 😊

Not bad, only about 1 1/2 years after I got the kite completed.</p> <p>Here's a couple of pictures from it's first</p> <p>flight....</p> 

The flight was mostly a success. I still have to adjust some of the tension lines a little, and play around a little with the bridle lines. I was so happy to finally get the kite airborne, that I decided to just let the kite fly. Winds were pretty marginal, only about 6.5 to 7.5 mph. The kite flew fairly well and stable as long as the winds were over 7 mph.

<b>Dorsal</b> Kite Builder II  Joined: 05 Oct 2003 Posts: 714 Location: USA California Tracy - 50 miles to the right of San Francisco	<div> <input type="checkbox"/> Posted: Wed Jul 26, 2006 12:32 am Post subject: <div>QUOTE</div> </div> <hr/> <p><b>What went wrong?</b> I really don't know. I drew the completed assembly as a solid model using I-Deas (software we use at work.) Then (I thought) I created views of each of the respective panels by orienting the view so I was "looking" straight in at the panel. I then used that view (which should have been a true view of the flat pattern of material) to create my cutting template. What I got instead was a flat view projection from an angled view of the panel. (Like closing one eye, looking at a 60-foot bus from up near the headlights, and thinking the bus was only 3 feet long and kinda tapered from front to back.)</p> <p>What jerks me the most is that I have done exactly this same method many times at work, and never had a problem. I can't imagine what I did wrong, but the end result was very FUBAR. After I finally saw the problem, I went into my drawing model and could immediately see what had happened. Why didn't I see it before I cut and sewed 144 pieces? Who knows?!</p> <p><b>What can the rest of the Forum learn from my mistake?</b></p> <p>That no matter how wrong everything goes, a crummy day sewing a kite beats the tar out of the best day at work! And that anything can be fixed if you use your imagination (instead of shoving it into the fireplace like I was sorely tempted.) 😞😞</p> <hr/> <p>"The wind is the perfect reminder of God.  The only way we can prove it exists is by observing the things it affects.  That's why I believe in the wind, too."  Dennis  Baha'i Faith</p>

When you lay all your panels end to end a, b, c, ect. do the leading edges form a zig zag line?? When I built my first star and layed out the panels to see how they would look I was shocked to see they didn't form a straight line. The tip of the outer most panel will be close to tangent to the centerline of panel A. When tension is applied all the panels will recieve equal tension and will not deform and get wrinkles. Keep us informed</p> <p>CLIFF</p>

[QUOTE](#)

I know i am really late to the game here...

but just wanted to let you all know how inspiring all the posts on this thread are. I actually read all 61 pages (it grew to 62 in the meanwhile....) and decided to give it a shot.

I had been wanting to do one for a while, but like a lot of people was kinda dreading all those edges.

I decided to edgebind. My back is still killing me from sitting at the sewing machine all those hours. But now that i have flown it, all that kinda fades away!

quick specs:

to save \$\$, I fabricated the center hub myself out of 2-part epoxy putty

i used p400s ferruled with long (8") solid [Graphite](#) and thread wrapped at the joints and plugged with 5" solid [Graphite](#) where they enter the hub

i used Steve's MKS fittings at the points

haven't weighted it yet

I know anything I could say in praise of what a great design this kite is has already been said, so i'll just say thanks again and encourage anyone who is on the fence about making one to JUST DO IT!

[QUOTE](#)

A year ago I got one of the 4.5 ft Lotus kites for a birthday present. (Small double star)

Last weekend I saw that Harbour Freight had some the same kite for sale at \$6.xx. I thought that at that price I could get two or three and put them together for a huge box kite, like I saw in a picture someplace.

I thought "Kite....Harbour Freight....how good could they be? Well, I went and bought one. I got home, pulled it out of the package, and put it together, sort of. I found that it was a bit overpriced at \$6.xx! The sewing was shoddy, the parts did not fit, and it was made from hot cut (I think) Nylon material. Not [Ripstop](#), and not very crispy. Rods were fiberglass tubes, small diameter. Save your money, and do not buy one of these things. 😞

Why@ , welcome to the Double Star Club. Good looker. We all know how you feel about your accomplishment. Isn't it strange how all the pain and stress that was part of the project disappears when the D.S. flies for the first time. It's amazing. Glad your happy. Job well done. Oh, very creative center hub by the way. Good use of sparing also.

[QUOTE](#)

hey thanks a lot grant & cliff.

cliff: it IS funny how it all fades away. still, it amazes me that after your first one, you turned around and made your MASTERPIECE knowing how much work you were in for...

here's a question: has anyone experimented with moving the tow point up and down the bridle? I had a chance to fly the DS in pretty steady wind for a few hours yesterday. the wind speed changed over time but everything else was pretty constant. so I tried some experimentation

it might just be my imagination, but it seems like moving the tow point higher (i tried as much as 3" towards the upper [Bridle Line](#)) makes the kite sit more upright, and puts less stress on it in high wind, at the price of less lift and a lower flight angle. moving it lower gives it more lift in light wind.

On my small DS the spars had a slight bend . I initialy used 10 mm spars and those spars ocasionaly would bend if the sail was dry . When I put the kite on a diet and replaced the 10 mm's with 8 mm's these would bend more. I didn't think bending was bad. The important thing is that each spar has an equal amount . On my large Star with 12 mm spars I normaly keep them straight.</p> <p>CLIFF</p>

some interesting observations on what I would call a large kite.

Moisture effects sail size of RSN

Heat effects the size of all materials in diffret amounts

Length and Stifness of spars effect sail shape

And we as kite builders have to take all of that into account when selecting the componet parts for our creations.....

So what I have read between the lines is that we are Mechanical Engineers as well as Artists because our kites have to fly, as well as being pleasing to the senses.

Food for thought.

funny you should mention this topic, fool...

i have cut the spars down a 1/2 at a time as i refined the endcap solution (final: mks fittings) and i have been wondering which of the following is correct:

1- the flexed spars (besides looking pretty cool, i think) give the DS more "bounce/flex" on rough landings, thus adding durability

2- straight spars would be stronger on rough landings, thus adding durability.

i don't really know which of these is true, since i haven't cut them enough to be straight, mostly because of the tension issue you mentioned. i'm afraid if i cut them too much, when the RSN stretches over time, the DS will become too loose.

so far only a very rough landing in the beginning has broken a spar. and super high winds before i thread-wrapped the joints broke one also. (sidenote: that break was actually kind of cool-looking because it allowed the line to slip off one end of the horizontal spar and the whole thing collapsed like a flower in mid-air. sad but neat looking anyway)

since i used p400s, which are wrapped tubes, instead of pultruded, i feel like i've been able to get away with a lighter, smaller diameter frame, although a couple of times in high winds i have chickened out and taken it down when it starts flexing or deforming. So far about 18 mph has been the limit of my courage...

ps: it launches at about 6-7 mph with steady wind.

It sounds like you have ben haveing a lot of fun flying your double star.

I to have issues in cutting spars to short.

I keep looking for a spar stretcher, but I cant find one.... 😊

Carefully cut the spar in half at the midpoint, spread them apart until they are the correct length, then glue them back together again with B.S. glue. 😊

[QUOTE](#)

LOL !!

and on the other side... i have become really great at finding uses for all the shorties of trimmed skyshark spars.

pretty soon everythin in my house will be made from pieced-together Carbon fiber tubes!

and yes, it is a lot of fun to fly. and using the storage method so helpfully posted here, it actually is pretty quick and easy to set up and take down.

and it has even surpassed my giant red ghost delta as far as people coming up and saying ooooh aaahhhh. probably one of the best comments i consistently get is: "it's so beautiful, it looks like it shouldn't even fly". that is a pretty interesting feature of the DS: with what appears to be so little sail area enclosing all that empty space, it is such a hard-pulling kite.

and i still like the way that, when i have all the radial spars in place and stretch out the 2nd horizontal spar, the radials all snap into their curves and it kinda springs into shape.

. . . "it looks like it shouldn't even fly".

That's one of the best comments I enjoy hearing.

Along with, "how the heck does that fly?"

I like the designs that, to the non-builder, 'look' like they shouldn't fly.

QUOTE

Time doesn't matter to Cliff.....he's retired!

I'm another double star builder and flier. Some folks have asked me how long it took to make. By now, I can't even remember. I just know that if I made another 10 point double star, it would probably take about 20% longer. There are some things I did on mine that I would take more care doing the second time around. For example, I'd be a lot more precise cutting out the pieces and joining them together. I'd probably try to get someone to make templates for all the pieces from something more substantial than mat board. I'd also hot tack all the pieces together, maybe make the edge binding quad fold, rather than dual fold, etc.

Mine came out pretty nicely and it flies well as long as the winds are 8+, I just have some more kite making skills 18 month later and could make it better the second time around.

**Why@urp wrote:**

i know what you are saying about angle of all kites. 🙄 but this kite doesn't fly at the same "overall kite angle" as other kites if that makes any sense. where most kites fly like this: / the DS flies like this: \

i realize that that KITE angle makes most of the individual PANELS sit like this: / but since there are soooo many angles involved i was really wondering how much angle change anyone had experimented with on a DS to accomodate varying wind speeds...

Yup yup, I hear ya. 😊 I should clarify. . . .

Your looking at the overall kite, and not the areas that are creating the lift. The overall angle of the kite is not what you focus on when determining the AoA.

In some cases the entire kite IS the lifting area. (Roks, Eddys, Genkis, etc. . .) But in the 'complex' kites (cellular, dimensional, etc. . .) it's the horizontal panels (when the overall kite is vertical. . . AoA=0deg) that are going to turn the most air downward, and create the most lift, when the AoA is increased.

In this sence all lifting areas will be sitting like this: /

In other words: Each kite type has a specific AoA that produces lift sufficient to overcome it's weight at each wind speed.

Regardless of the AoA you start with on the ground, it will have the same AoA when it reaches equilibrium, relative to the wind speed. The difference will be in it's height above the ground.

Assume you start with an ground AoA of 30 deg. As the kite increases in altitude, the AoA gets lower, to the point where the lift equals the weight of the kite (equilibrium). If the wind speed

	<p>increases, the kite gains altitude, and visa versa.</p> <p>Force(lift) = Mass(air molecules) * (Wind)Speed</p> <p>In practical terms: A lower wind speed requires a higher 'ground' AoA to acheive the same altitude, and visa versa. Soooo. . .Set your ground AoA to acheive the desired altitude. 😊</p> <p>😊</p>

My cutting mat is too hard to get a crease so I used some poster board from the office supply to lay the fabric on. Using my straigtdge I can line up the hem width and pressing down on the fabric with the knife I can run up and down a couple times and get a beginning of a crease. Once I got the hang of it I got the pressure just right. I got the 520 hems done in about 15 hours. It seems like a long time but this is probably the hardest part to get through.</p> <p>Using my thumbs from the center of the fabric I finish the crease in both directions. I can get the hem as small as 1/4" no problem and it comes out straight.This kind of wrecks the poster board after 520 hems but it's less time consuming than trying to get a straight crease any other way I tried.</p> <p>Because the poster board was too short for some of the panels I used clear box tape on the back side to join pieces.</p> <p>Other things I learned is that doubleside tape is the way to go to hold the panels before stitching. I never would have gotten them flat otherwise. Steve has some tape called C3 which was the best. There's 55yd on a roll and the DS takes almost a whole roll.</p> <p>Other thing I learned is that Cliff is the best. (no, seriously!) He IS the king. 😊</p> <p>Spectre's plans were as good as I've seen, and his detail was just what I needed to see.</p> <p>The last thing I learned is that I could not have done it without the Forum.</p>

I need to try it myself!!!!!! Thanks for sharing, as I too have now learned from your kite build. 😊 😊</p> <p>I have what I call "litter on a stick" most of you have seen it. those corigated plastic signs advertising everything that nobody wants.... Well, when I am driving around I pick up as many as I see. some I take to the plastics recycling, but the new ones on the wire bases, I bring home and use for things.... I will try one inplace of the posterboard in Popeye's creasing methond to see if it works.</p> <p>And Popeye, thanks for sharing!!!!!!!!!!</p> <hr/> <p>VR/            KiteSquid            AKA Takolka            AKA Harold            King George VA</p> <p>P.S. QUOTE

They have a tiny iron at the quilting department at my fabric store. The ironing face is about 1 inch from tip to base.

Looks like a great tool for ironing seams, light weight, too. However, the people selling the tiny iron are quite proud of it, if pride is reflected by price. 🙄

I will stick to some variation of the table knife method previously suggested by Popeye.

by the way, Why@, here is a picture of your new tube.

It is the photo I posted when I put the tube up for auction. Nobody bid on it, so that made it worthless. You, my friend, got a worthless item! 🚫 🏠

Someone on the forum from Norway suggested using a credit card, but that doesn't work for me, a metal edge is what I found works best. That little iron? I looked at too-yeah it's pretty pricey..</p> <p>Something else I just found but have not tried out is called foam sheet. I found it in the Kids craft section of the fabric store. It comes in several thicknesses and sizes up to 24" x 36" It's more expensive than poster board but might do the job. I bought a small piece of 3mm thick to try out. The poster board is cheap and disposable that works for me.</p> <p>What kind of signs do you mean Squid? Like the ones the window guys stick on people's lawns? Hey, I bet you could get lots of free posterboard after an election. Why, it would kinda be like recycling.</p> <div> <a href="#">Back to top</a> </div> <div> <a href="#">PROFILE</a>  <a href="#">PM ME!</a> </div>

I will stick a Tapestry Needle into a handle to test this. Think of a blunt ice pick or awl.

Tapestry Needles are available at most craft and sewing stores.

They have blunt points and are available in many sizes.

I have some on hand and will probably use the one with the largest diameter.

Other tools that may work include the Hera Marker from Clover:

Clover's Hera Marker For Applique & Sewing:

An awl that has been blunted, like Clover's Ball Point Awl:

OR maybe the point of an old credit card..... or other piece of plastic that would noramly go to the landfill.

It was the Hera marker that I'd seen on the quilting side.....

Trying last night a dinner knife worked fine 😄😄😄

Better resting on card or a newspaper tehn my cutting mat

with the length of this thread and how far back it goes, what is the current parts list for this project?

After reading through 10's of pages, you have all talked me into building one... it looks fascinating...

Thanks!

Spectre's plans give a pretty good materials list for framing, etc.

I just looked and I bought

4 yards for "A" panel color

5 yards for "B" panel color

3.5 yards for "C" panel color

3 yards for "D" panel color.

I had some extra at the end but it's better than coming up short.

If you go back (I think it's around page 48 )

Cliff gives some really great advice on doing the D panel tips with "d" rings. That's how I did mine and the look is really sharp.

You know ever since you all got me to set it up in the living room, I kind of, um.. you know, left it up 😊

Sorry about that cbabbman 😊 Grant's right- they were triangles, I used D's because Steve didn't have the triangles at the time. I used Grant's reinforcement approach. and used grosgrain for the loops as well. Sorry if I messed you up</div>

<div>Popeye</div> <div>Joined: 01 Jan 2007</div> <div>Posts: 25</div> <div>Location: Brighton MI</div>	<div><div>Posted: Sat Mar 10, 2007 11:01 am</div><div>Post subject:</div></div> <div>QUOTE</div> <div><p>Yep use MKS</p><p>I used 10mm pultruded <a href="#">Graphite</a> tubing (60"). You need 12 pieces.</p><p>#RLG394060 ( I also got a couple spares because if you crash and break one you'll have to fly something else till you get a replacement.)</p><p>When I got to final assembly I found that I didn't have to trim the spars. The tips of my spars are only about 2" away from the tip of the D panels giving me a little room for adjustment later.</p><p>Get the 10mm MKS #CMKS500, you need 12.</p><p>Steve's Tinkertoy fitting #CTTU500 is the one to get. I was going to build my own but why? when you can get an accurately machined one.</p><p>I used the 1/2" Aluminum D ring #LALD50</p><p>You <u>can</u> find Grosgrain at the local fabric store. You'll have to search the aisle where they have the ribbon. I used 1/4" but Cliff said 3/8" would be better. I wanted black and they only had it in 1/4" but it's pretty strong.</p><p>I did my tips a little different than Grant. I used one ring at each tip and ran four 150# lines through the MKS. Two from each side. This way I can tension each tip independently. By the time you get all four panels stitched out to length, all the slight variations in the seam width will show up in the lengths. I was worried that if I did not have the abiltlity to tension each I might get a sag or a wrinkle.</p><p>To get four lines through the hole I cut two pieces about 24" folded them in half and put a single piece through the bend. Put the single line through the hole in the MKS and pull the lines through. It's tight but you can do it. Once you got the bend through just cut at the bend and you have four lines.</p></div>

<div>Popeye</div> <div>Joined: 01 Jan 2007</div> <div>Posts: 25</div> <div>Location: Brighton MI</div>	<div><div>Posted: Sat Mar 10, 2007 11:06 am</div><div>Post subject:</div></div> <div>QUOTE</div> <div><p>Oh I forgot, about the spine fittings.</p><p>I used the same MKS as the tips. That's why you need 12.</p><p>I don't know what others did but I put two 250#'s through. The MKS has that little lock screw which holds the line. I found that if I loosen the top and pull the center down it releases the tension on the tips and makes setting up and taking down a snap.</p><p>And yes it was fun to build.</p></div>

I had most of that stuff in my cart...</p> <p>Another question for the group... I'm contemplating edge binding everything as I want the stained glass effect... Steve sells both edge binding and pre-cut 1" &lt;a href="http://www.kitebuilder.com/catalog/index.php?cPath=24_108"&gt;Ripstop&lt;/a&gt;...</p> <p>What's the real difference and what have you guys done/used in the past for this?</p> </div> <p>The edge binding Steve sells is more of a trailing edge material for a sport kite. You'll want something that will stretch with the fabric. Get the 1" precut rip-stop. I used I believe 4 or 5 52yrd rolls. Also it would be worth picking up a universal double fold edge binding attachment from ebay. Even if you don't want it to feed directly into the machine you can use it to quickly fold the 1" twice into 1/4" finish. There is a lot of info on this attachment on this forum that can be found with a quick search. 😊</p> <hr/> <p>Chris Taylor            Dayton, OH            lowerdfool(at)yahoo(dot)com</p>

<b>scooterandre</b> Joined: 19 Oct 2006 Posts: 1 Location: Oldenzaal (Netherlands)	<div> <input type="checkbox"/> Posted: Tue Mar 13, 2007 8:46 am           <span style="float: right;"><input type="button" value="QUOTE"/></span> </div> <p>Hello, fellow DS-builders.</p> <p>First, I want to thank you all for the good tips and tricks in this topic. Without them, it would have taken much more time so far.</p> <p>I am also making a double star and have just finished the hemming.</p> <p>However, in all those 69 pages, there is one thing I miss, a detailed photo of the center. Is there any reinforcement in it? How long are the lines, which are sewed at the centre and how many are there?</p> <p>Greetings from the Netherlands,            André ter Pelle</p>

<a href="#">Back to top</a>	<a href="#">PROFILE</a> <a href="#">PM ME!</a>
<b>Grant L</b> Kite of the Year 2004  Joined: 16 Sep 2003 Posts: 1507 Location: USA IN Indianapolis	<div> <input type="checkbox"/> Posted: Tue Mar 13, 2007 9:39 am Post subject: <div>QUOTE</div> </div> <hr/> <p>From memory, I did sew dacron reinforcement to the pieces that had the center lines sewn to them. I sewed two lines to each of the center pieces on opposite sides of the spine sleeve. (I haven't done it yet, but I have considered sewing one line to each center piece, on the inner side. When you are first assembling the kite, there is very little tension and the spine end caps on mine tend to keep sliding off of the end of the spine 😊) Start out with them a couple feet long, ( way more than you will really need,) and then trim them once the kite is assembled. You can leave extra for later adjustments. The tension really does vary with humidity etc. 😊</p>

There's enough to write a book. 😊</p> <p>Seeing other members still building this beautiful kite is rising the pressure for me to build one too. It's going up in my priority list. I can't wait to have the time to build one.</p> <hr/> <p>Smarties 😊  <a href="http://www.yvonhache.com">http://www.yvonhache.com</a></p> <p>To boldly go where no imagination as gone before! 😊 😊</p>

## KITE PLANS

### DOUBLESTAR

#### PARTS

1. 11-12 meter, 150 cm wide ripstop nylon (Color 1: 275cm, Color 2: 380cm, Color 3: 300cm, Color 4: 200cm)
2. 11 x 150cm (60inch) 10 mm Carbon Tube
3. [A Ten Point Center Connector](#) (HUB/Tinker Toy, mine is wooden. I used 3 mm wood. Has a dia of 13.5cm and height of 1.8cm)
4. Dacron reinforcement.
5. 2x10mm nocks.
6. 10 endcaps.

#### PANELS

Here is the Panels dimensions in several formats. The original dimensions are in Centimeters. I also convert them into inch. But I recommend you to use metric. If you have any CAD Office in your area, it is good to print them.

JPEG	<a href="#">Centimeter</a>	<a href="#">Inch</a>
AutoCAD 2000 DWG	<a href="#">One unit is one Centimeter</a>	<a href="#">One unit is one Inch</a>
PDF (A1 Paper Size/cm)	<a href="#">PANEL A</a> / <a href="#">PANEL B</a> / <a href="#">PANEL C</a> / <a href="#">PANEL D</a>	

I show every panels in diferent **COLORS**. Panel A is Blue, Panel B is Red, Panel C is Green and Panel D is Purple. You need 20 x Panel A , 40 x Panel B, 40 x Panel C, and 40 x Panel D. This **PICTURE** shows how I cut the panels to minimize Fabric use.

#### SEWING PANELS(ONE HALF)

We will sew front and back of the kite. Front and back of the kite are same.  
You need 10xPanel A, 20xPanel B, 20xPanel C and 20xPanel D for each side.

You must sew reinforcement two of the Panel A for each side of the kite. When sewing center these panel will be other side of each other.

Sew the edges of the panels. Double fold the [EDGES](#) and sew.

Sew the Panel A's(Center of the Panels) to each other shown in [PICTURE](#).

[Sewing Panel A -> Panel B.](#)

[Sewing Panel B -> Panel C.](#)

[Sewing Panel C -> Panel D.](#)

[Sewing Panel D -> Panel D.](#)

---

## SEWING POCKETS AND CENTER LINE

Now sew pockets for spars and connect to front and back side. Sorry about the sewing quality : (I used 5x10cm dacron. Because I forget the end caps of the spars, spars pierce some of the pockets so I sew a second layer of dacron which you can see in the [PHOTO](#).

For Center sew a line. Each end of the line will sew the darcon reinforcements on PANEL As. Do for back and front side. When I making my kite I made a mistake on the center. I sew wrong. So your center will be different.

[PHOTO](#) of my kite's center front.

---

## BRIDLE

The kite has a sipmle 3 point [BRIDLE](#).

---

## SPARS

The Center spar will be 150 cm and attach a nock eack side of the kite. The other spars will be shorter then 150 cm. Because you will use a Center HUB/Tinker toy the size of the spars will be different then my spars. You must calculate it or you must try the correct length.

---

## 8 POINT 2M DOUBLESTAR

Here is an [PDF](#) file of the 8 Point Doublestar Panels.

Sorry I put only in centimeters. But the PDF Document is in A0 Papersize. If you able to print in A0 size then you will have the original size panels.

For a strong kite I recommend to use 8 mm carbon tube. [But my friend have one with 6 mm spar](#). It can flight in very low winds. But I don't know the upper wind limit.

---

This is my first detailed kite plan. Please tell me any information which is missing above.

[Also, you can find lots of information about the kite in Kitebuilder Forum.](#)

---

Gibt es eine bessere Art, Sterne vom Himmel zu holen, als diejenige mittels einer Drachenleine?! Wohl kaum. Deshalb verwundert es auch nicht, dass Sternförmiges in den unterschiedlichsten Ausprägungen unsere Drachenhimmel bevölkert. Der hier vorliegende Sterndrachen von Wolfgang Grimsel (Fa. Colours in Motion) trägt mit seinem stolzen Namen und seiner interessanten räumlichen Gestalt jedoch nicht schwachen Lichtschein sondern pralle Blütenpracht ans Firmament...

## Lotus

10-strahliger Sterndrachen der Firma Colours in Motion; solide verarbeiteter Drachen mit bezaubernder Optik; 120 Segelflächen aus Spinnakernylon, Gestänge aus 4mm Fiberglasstäben und einem, die Waage aufspannenden, 6mm Karbonstab; ein munter tanzender aber stets zuverlässiger Flieger, der bei jedem Publikum Beifall findet. Eine stattliche Erscheinung mit 150 x 150 x 60 cm mit einem reisefreundlichen Packmaß von nur 75cm. Lieferung ohne Anleitung (s. unten) in einem Nylonköcher mit ca. 50m Schnur auf einem einfachen Handgriff (empfohlene Bruchlast der Flugleine: 65 kg)

**Preis:** inkl. MwSt. **79,- €**

Zubehör gleich mitbestellen:

Wir empfehlen unser **Schnurset für Einleiner: 100m Dacron, 65kg** Tragkraft, flugfertig mit Wirbelkarabiner auf einer Ringspule und **Kitefix, unseren kombinierbaren Spezialbodenanker** für nahezu alle Böden und Drachengrößen

#### Details:

Die Befestigungsmethode des Gestänges an den Spitzen des Sterns ist nun (ab dem Modelljahr 2005) sehr haltbar und praktikabel gelöst (... bei Vorgängermodellen gab es hier eine Schwachstelle...)

#### Zum Aufbau:

Auf dem zentralen Mittelstab befindet sich ein massives, rundes Verbinderteil mit 10 gleichen Löchern, in die die Spannstäbe eingesetzt werden, über deren Splittkappen die Verbindungsleinen zwischen den roten Segelspitzen eingehängt werden (mittleres Foto re.).

Der zentrale Mittelstab ist in einer Stabtasche, an der sich der zentrale Waagepunkt mit der fest angebrachten Waageleine befindet, die zu dem einzig dickeren (6mm Karbon) Spreizstab führt. Beginnen Sie den Aufbau mit diesem dickeren Stab an der Waageleine. Achten Sie darauf, dass die Waageschnur vom Mittelpunkt genau in die Richtung dieses dickeren Spreizstabes zeigt (das ist im Flug die Strebe vom Mittelpunkt zur untersten Sternspitze, die den Druck der Waageleinen aufnehmen wird (vgl. große Fotos ganz oben)).

Danach setzen Sie die übrigen 9 gleichen Spreizstäbe ein, um das Segel aufzuspannen und befestigen die Flugleine an der kleinen Schlaufe der Waage so, wie auf der Skizze rechts dargestellt, fertig.
